I heard that one of the designers of USB was responsible for the "good ol'
Atari serial port".

Makes you wonder where Atari might have been today if nepotism hadn't
destroyed it.

I need examples of the Load exe problems. I have communicated the same
issue to the Atari800 group and everybody told me I was crazy. Since I
have very, very limited time to spend on this, the best thing to do is
send me mail, or the a8 mailing list mail, detailing which executables
do not work with web-links to the exe modules if possible.

John,

What I'm abut to say can be debated until the cows come home, but it's my impression.

Atari managements, all four of them, seemed hell-bent on destroying a good thing. They employed some extremely clever engineers, programmers, etc., enjoyed what I feel was a particularly patient and loyal user base, and then turned all the positives into negatives with gigantic marketing snafus.

The nepotism to which you and many others refer was real, but only one of the factors that killed Atari.

I believe that if it weren't for the user community, Atari could never have existed as long as it did.

There! I've started another (groan!) thread to which I probably won't contribute anything further :-)

The manual says when the shields are on there is a bluish tint to
space. All the TV's and monitors I've played it on showed blue.
I've tried adjusting the colors in Atariwin but haven't had any luck.
I've been able to adjust the monitor colors but it screws everything
else up so I just live with it (or play it on my 130XE).

That and the fact the photons don't 'sparkle' like a real Atari are
the only two things wrong with it in Atari800Win.

Well, I'm still waiting for the emulator that will display Star
Raiders properly, namely with blue shields and 'sparkling photons', so
if yours can do this, then hell yes, I'm interested.

>Steve,
> How do you tell on the inside of a 1050 if it has any mods?? Is it obvious?
>Thanks,

The best way to tell is to open a drive you know is stock and get
a feel for what they should look like. Generally the 1050 consists of a long
PBC w/ a drive mech mounted above it.

Inside the small metal cage there are normally a FDC, a RAM, a program
ROM/EPROM, a RIOT and a 6507 CPU. These are all large chips in sockets under
the shield. If your drive has been upgraded at all, it will show in this area.

The 'Happy' and similar high quality upgrades remove the 6507 and
install a 6502 PCB with a socket that plugs into the old CPU socket. These
you cant miss.

The US Doubler uses a large black ram pack that is much larger than the
normal RAM chip present in the 1050 and has 'ICD' embossed on the top. Some
clones may have a different pack but they are all larger than the standard chip
since they are basically modules that contain more than a single ram chip.

Steve

The other thing the emu's don't display correctly is the sparkling
effect of the photons, which might have something to do with
artificating on a TV, I'm not sure, but they sure look cool. On the
emulators they're just a solid color.

I have some mega ATR images with a lot of 8-bit games. There is alittle
program that will convert these into XFD or XLD files. Then I can load
those into a program for my ST that will take out the file and put them on
my hard drive. That is about as far as I can go.

My favorite was a shareware game called Gauntlet (which had nothing to do with the fantasy game found in arcades at the time). You piloted a ship through a maze of fractal generated landscapes and caves full of bad guys that shot bullets and smart missles at you. The smart missles weren't so smart, however, you could manuever your ship around the bad guys and make the smart missles lock on and destroy them! :-)

I recently re-acquired a lot of my old Atari disks only to discover the disk with Gauntlet on it was corrupted. :-(

Yes, I would. Hopefully tho, it's source code would be available thru
gpl license and would be truly portable so it would be able to compile
on something besides windows. remember that windows is not the only os
out there. maybe in 25 or 30 years windows will catch up to where OS/2
was 10 years ago.

ATR's are disk images - either boot or file accessible. Normal ATR's can be copied directly to an 8-bit 5.25; Mega ATR's can be used with MyDOS or SpartaDOS as just another disk - you can copy files from them to a normal ATR or XFD. You can then convert it to a real floppy. Some utilities will even extract files from the ATR so it could be placed on a floppy, thus saving a step.

-Ron

I don't have a solution but I admire the problem.

To my knowledge all of those were fixed. Have you actually tried the
new version, or are just going off information from a few months ago?

If they still do not work, then there is something peculiar. They work
for me.

Any version that uses the Atari800 source (and any of my source) MUST
be GPL. There is no other option.

It is completely counter productive to have 5 different windows ports
of Atari800. There are already three that I know of, and in this
thread two people point out they have worked on other versions,
without bothering to ask on the A8 list, without bothering to ask
me....it pretty much makes me feel like just halting development.
Since no one seems willing ot work with each other, what is the point?

Most of the game software for emulators are not ROMs, but usually disk images
with either files or bootable data; these can normally be copied/converted to
an 8-bit floppy. Even the ROM data might be convertible into a binary file.

AtariWriter and its "Plus" successor were just text manipulators (processors);
they would send mostly ascii data to whatever printer was connected. I don't
remember any printers with the Atari font in their character set ROM, but many
had provisions for custom ROM or downloadable RAM sets

There were also utilities like G:colon and Daisey Dot which would read atascii
data and send dot addressable graphics information to produce output in the
Atari font. If that is all you want then you might use one of the TrueType
fonts available on Vidar's site:
http://home.online.no/~olavese/

400,800,800XL,130XE, it's there.

The photons have a subtle sparkle effect (for lack of a better
description) to them when they're fired which the emulators don't
reproduce. It looks like an artifacting effect. Even Doug Neubauer
mentioned it in his Analog interview several years ago, he wondered
why no one else copied it. He didn't say how he did it, which is what
I'd like to know. I have to dig out the issue for the exact quote.

Yes, and Mr. Spock has green skin on your TV sets. I do have a PAL
Atari 800XL and an original Star Raiders cart, and the shields are
green.

Message-ID: <kWIg5.658$q_2.3554@news11-gui.server.ntli.net>
Source record: 43183

I have an 800 XL (PAL) beside me running Star Raiders on ROM. I also have the manual.

The manual states :

"S - Sheilds

The sheilds protect your starship. When they are activated there will be a blueish tint to space"

However, when I press the 's' key on my 800XL space turns GREEN ! When an enemy photon impacts the sheilds they flash blue.
This is exactly the same as when I play via Atari800win.

Were there 2 versions of SR ? (I have tried various settings on the emulator PAL/NTSC, 800, 800 XL, all artfact settings - not that there should be any artifacting)

Hmm anyone have a definitive answer ?

Paul

>don't know.

Most presumably it has got something to do with the NTSC (never twice
the same colour) display instead. Some US Atari games ("Hard Hat Mack",
"Loderunner") even used NTSC artifact colours by using patterns like
"01010101" or "10101010" in Gr. 0 or 8, which doesn't work properly on

PAL machines (though PAL also generates artifacts here, they are not of a single distinctable colour, but change from purple to brown and back).

Good calls. M.U.L.E. Archon. Ultimas II and III. The Infocom Zork
and Enchanter series. I also enjoyed an obscure APX game called
Excalibur (actually, I just played that a few days ago). Star Raiders.

It's amazing how much those old programmers crammed into 48K. These
days, with expandable memory, programmers just tend to require more
memory if something is complex. Fifteen to twenty years ago, they had
to perform wizardry to figure out a way to get everything into that
48-64K. Truly impressive. Even now, having been a programmer in
industry for many years, I marvel at that.

A question from someone re-entering the Atari 8-bit world. I remember upgrades for the 1050 drive which included Happy (chip) and US Doubler. I had an Indus drive which was a "smart drive." If I remember, they allowed the drive to read double and extended density disks.

What are each of these upgrades and what did they do? How did they compare to each other.

Thanks,
David

Well here is a breakdown of the few upgrades I own or have
seen.

810 Archiver. Replaces the program rom in the 810 with a one. This new rom looks and acts like a normal 810 disk drive until a special 'open' code is sent to it by the Archiver software. The drive can then copy most basic copy protection using the special Archiver software that comes with the upgrade. The upgrade can also be unlocked by turning on the 810 with the Archiver software disk inserted into the drive.

This upgrade does not add double density or any other features to the drive.

810 Happy. Similar to the 810 Archiver above but also adds a good amount of RAM to the drive used for sector buffering. Able to copy much more software than the original 810 archiver but still well quite limited. Uses the 'Happy Backup' software that comes with the upgrade.

1050 Doubler, US Douber, 1050 DoubleUP, etc. Ad 128 bytes of RAM to the 1050 HW map and adds a program rom capable of utilizing 256 byte sectors. The other upgrades here are all clones or ripoffs of the ICD US Doubler.

This upgrade adds 'True Double Density' to the 1050, which is basically a MFM format w/ 256 bytes per sector, 18 sectors per track. This gives more storage space than the 1050's 'Enhanced Density' MFM format of 128 bytes per sector, 26 sectors per track.

The upgrade also adds the ability to format a disk with a custom sector skew, this lets the drive read and return sectors faster since the custom skew reduces the rotation time the drive needs to find the next sector on the disk.

This upgrade also lets the drive communicate faster than a regular 1050 to any software that knows how to do it, such as Spartados. The regular speed is 19k bps, the 'UltraSpeed' speed is around 49-50k. This max speed is never actually reached because of sectors and track seek times. In sequential sector reads, such as booting a disk, it can reduce loading times quite a bit if the disk has the special 'skew' format.

1050 Happy. Probably still the most desirable upgrade for the 1050, this replaces the onboard 6507 controller with a real 6502 and a large amount of static RAM.

This upgrade lets the drive copy almost all copy protected software using the Happy Backup software. It also adds percom compatible double density capability to the 1050.

The drive also has a dazzling number of features that can be turned on and off via the Happy Backup software. These include the ability to to trace copy protected disk boots, make high speed copies one source to multiple destination disks, simulate the US Doubler high speed upgrade, etc. There is even a program that will load a modified 810 archiver ROM into the 1050 to make it run the 810 Archiver copy software.

There was also a 'Controller' option for this upgrade that added 2 toggle switchs and an LED to the 1050. One controlled the drive speed, FAST/SLOW, basically enabling/disabling the internal track/sector buffer. One was a 3 position switch that controlled the disk write protect. The switch could be set to Normal WP/Always WP/Bypass WP. The LED showed the current WP status.

1050 Speedy. There are a number of different 'Speedy' upgrades for the 1050, the one I have is called the 'Mini-Speedy' I believe. It adds double density and high speed I/O, as well as a built in DOS system that can be booted by turning on the drive without a disk in it.

There are a number of other programs for the Speedy as well but I cant comment on them since many of them are designed for PAL systems only and I cant use them. I believe some version of Speedy supports a copy protected backup system but I have not seen the software myself.

Isn't Spocks skin supposed to be green?. But the shields are _supposed_ to be blue. Here's what the manual says:

"S- Shields
The Shields protect your starship. When they are activated there will be a bluish tint to space. When the shields are not activated space will appear black."

Maybe it's something with the PAL display that shows it as green, I don't know. I've owned this game since 1981 and played it on a 400, 800, 800XL, 130XE and on more TV sets and composite monitors than I can count. Where I live they're blue as my wifes eyes <g>.

Someone else just posted with a PAL 800 and his are green, so it
sounds like that might be what's causing the difference in color.

I played it on the ST -- it had "graphics" insofar as there was a line
drawing of a map of your current location and visible exits. I played
it for a bit but hadn't encountered any more than that. Otherwise it
was your typical Infocom adventure.

Has anyone given any thought to the possibility that this might be a
PAL/NTSC difference? There tends to be a slight colour shift between
PAL and NTSC games (compare any 2600 cart in both PAL and NTSC
flavours) and this is most likely what's happening with Star Raiders.
It's entirely possible that the binary floating around was a PAL dump,
and therefore won't look correct on any NTSC machine or emulator.

Just a thought.

Hi all

I just remebered a game I played alot here in the UK. It was called Collapse and was marketed over here on the Firebird / Silverbird label.

I can't find an atr of it anywhere. Does anyone have it ?

I'm also looking for a GOOD scan of the Bounty Bob Strikes back tape cover (ie the whole thing, front and back). I have an original copy on tape but no cover ! can anyone help ?

Even better would be originals on tape, disk or cart for sale !

TIA

Paul

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

> emulators they're just a solid color.

A) I see a perfect sparkle in Atari800Win (any version will do).
B) The color is definitely wrong in the emulators as opposed to a real NTSC Atari running the exact same binary image. In fact, throughout the whole game the stars, text, and background in many states (shields on, long range scan, etc.) are all green instead of blue.
C) In the Galactic Chart (press "G") the top part of the screen is green, whereas the rest is blue. On the real Atari the whole screen is blue. This whole issue may be a (really strange) glitch in the emulator.

I apologize.

Of all the games that didn't work with 2.6a, only one game doesn't work
now - but that was the first one I tried. And it's Joust. And as long as
Joust doesn't work, I stick to 2.5c. ;-P

The CLICK sounds are very annoying though.. Please solve this bug.. I
thought I was getting them because I was on a slow computer (P-100), but it
seems to happen on a 400 Mhz machine just as badly.

Any of you folks on either of these two groups this is being posted to know anything about a synthesizer keyboard called the Music Mate? It's from Sequential Circuits of San Jose, CA and has an Atari-style connector to go into a controller port.

I asked about this on rec.games.video.classic, and the only response I got suggested I ask on either comp.sys.atari.8bit or comp.sys.cbm. So, I just mostly need to know what system this is for and what software is needed to run it.

Here is a picture of it:

http://www.oz.net/~otter/images/music-mate.jpg

Any info I can get on this little beastie would be greatly appreciated.

Thanks.

Not to harp on this forever, but trust me, it's a better effect on a
real Atari on a TV or composite monitor. It's minor I know (like the
green stuff), just something that happens to stand out to me, I've
played this friggin game a wazillion times over the last 19 years <g>.

OT, but just to show how good it still is, my little nephew, who has a
Dreamcast, is hooked on SR, every time he comes over he has to play
it.

Yep, I've tried it on every emulator that will run it with the same
results. No biggie, I just wonder if a later version of an emulator
can fix it.

I have just looked at the same Starraiders cart in both NTSC and PAL
machines on my 68CM Sterio colour tv using the video in. Pal Is Green,
Ntsc is Blue. Strange that. Both pal and ntsc should produce the same
or very similar colours for each tv standard. That is how the chips
were designed so games would look the same.

>Hmm anyone have a definitive answer ?

The GTIA COLBK register is loaded with 0xa0, which is - look up in the manual -
green. And it looks green here, in the emulator, and on my 800XL.

Blue would be in the range of 0x70,0x80,0x90.

Greetings,
Thomas

The emulator I've been talking about is not based on the Atari800 source. My partner and I have a different philosophy on the basic architecture than Atari800. Portability was fairly low on our priority list. Accurate emulation was the highest - this includes the emulation of every hardware register, every option, as many game controllers as possible, every floppy format, hard drive emulation, console sounds, keyboard, clock-synchronized display, support for as many OS versions as possible, support for PAL and NTSC emulation, etc.

We aren't quite there yet. There are still some details on handling some of the uncommon OS ROMs, not all controllers are emulated, the 17-bit polynomial sound is still not accurate, and the artifacting is still "fake" rather then fully emulated.

We just got sidetracked onto other projects before bringing this to completion.

--Doug

P.S. If you don't know who I am, I worked with Dave Small on the Spectre Mac emulator for a few years. I was the sole programmer on the last two versions. Also, my partner in this project wrote some of the most-used Atari 8-bit software out there (I need to check with him before I release his name here).

Maybe, yes. It's at least strange that the US version, even taking the
common NTSC "phase shift" into account, produces something entirely
different compared to the PAL version. 0xa0 is some kind of blue-ish
green, but it is definitely green and not blue.

So long,
Thomas

>I had an Indus drive which was a "smart drive." If I remember, they
>allowed the drive to read double and extended density disks.
>
>What are each of these upgrades and what did they do? How did they
>compare to each other.

The US Doubler is a controller chip upgrade from ICD and was properly named; it enables the 1050 to read/write in single, 1050 enhanced, or True Double (256 bytes per sector) density. It is also capable of changing the order (skew) in which sectors occurr in each track when so instructed by a compatible DOS; this enables data transfer to be faster using the supporting disk operating system.

The Happy is a "programable" controller chip which is capable of writing almost any conceivable custom data format; this enables it to duplicate many of the commercial copy protection schemes from the '80s such as "bad" sectors and extra sectors per track. Happy is capable of single, enhanced 1050, and true double density which it auto selects whenever a disk is inserted. Happy V.7 can also read/write 5.25 PC SSDD 180K disks. Happy has its own rapid I/O method which I believe involves an in-drive memory buffer; I think it reads the entire track in one pass and re-orders the sectors before putting them on the SIO bus in the correct sequence for the D: handler. Happy should theoretically be able to duplicate the ICD sector skew, but cannot generate it without the Happy software as does the US Doubler.

>program, so that it gets started when i turn the computer on? and what
>about compiled turbobasic programs: do i really have to loadt the
>"runtime.com" and then load the compiled basci program manually?

The DOS 2.0 compatibles (2.0, 2.5, MyDOS, SmartDOS, TopDOS...) look for during boot and if present execute machine language binary files named "AUTORUN.SYS"; these executables could be an application or can be used to patch into the E: screen editor's "get character" routines and pass commands (such as RUN"D:MYFILE.BAS) to the cartridge. There are many utilities including one from Atari in the DOS 2.5 master disk to generate these autoruns.

SpartaDOS and DOSXL support batch files and look for "AUTOEXEC.BAT" which can perform similar tasks.

TurboBASIC also supports some automatic boot conditions and looks for specific file names at startup; just rename "runtime.com" to "AUTORUN.SYS" and name your compiled program to "AUTORUN.CTB". DOS will then start the run time package and load and execute your file.
hope this helps...

>were designed so games would look the same.

Unfortunately that's not how it always works out. PAL users across
the pond tend to refer to NTSC as meaning "Never The Same Colour" and
in part, it's sort of true, since there are some colour differences on
computers and game consoles between PAL and NTSC editions.

We never really decided what to do with it. We'll probably just release it
as freeware and try do keep up with some minimal maintenance. I just see any
way we could make any money from it.

I misunderstood, and apologize if it sounded wrong in the earlier
thread. Indeed this is a great idea, one that I have toyed with
several times myself. My actual priorities in emulation are accuracy
before all, speed after that, with the rest falling out of the
details.

To this end I have several times thought of starting a cycle-exact
version of an Atari800 emulator, without any hackish approaches to
display systems (as definitely occurs right now in the Atari800
codebase, good as it is)...doing PMG as real PMG, etc.

>rather then fully emulated.

Since artifacting is an analog effect and not part of any hardware
design, it's rather difficult to get "right". It would be severely
changed by the "hue" and saturation (color) settings on most sets
anyway - just goes to show how it is a secondary effect of NTSC and
has nothing to do with the Atari really. My sympathy for trying to get
this right...it's not easy to do :-).

I didn't mean to portray myself as being against Atari8 emulators
using different code branches, or even against improvements to
Atari800 source (I am most soundly for both). I just think that when
people are working on common code, that they should work together -
it's the nature of open development. I got the wrong impression from
reading your original post, my mistake entirely.

If there is anything I can do to help you with this project, please
let me know! I'd be happy to chip in, assembly routines for display,
writing some real object code for the usage of DirectX, that type of
thing.

A product I remember well, and what is Dave up to these days btw? I
can still clearly recall watching Dave type up, on the fly, several
hundred lines of 68K code for an experimental mod to Spectre at an
Atari convention in Washington D.C....watching him compile and run it
without a single mistake in either syntax or logic. Very humbling. :-)

It's really amazing how much processing power is need to emulate the custom
hardware accurately. When we first started on this, a 90 MHz Pentium was our
target, and that was just barely enough. With today's hardware, speed isn't
nearly the issue it was then. We jumped through a lot of hoops to keep from
refreshing the entire screen each vertical blank (which most other games and
emulators do). We wanted the emulator to multitask with other apps on the
PC.

Yup. This is very complicated. I haven't even come up with a satisfactory formula for calculating the normal colors from Atari's hue and saturation values (converting this level of NTSC to RGB is no small task). I ran a real Atari in a video capture card and sampled the colors from that - it's OK, but not quite right (the captured video looked somewhat different than the TV next to it).

I think the next thing I should do is see exactly where we left off (I haven't done much with it in the last year or so - just a few quick updates. I definitely need to make a change so it doesn't crash if you use an "unsupported" OS ROM version (the OS patching code for the H: device fails).

> industry for many years, I marvel at that.

Same here, I was always super impressed with how much they could do with so little. Makes me wonder why so many commercial games that I install on my pc these days requires 200 megs of disk space and you *still* have to have a cd in the drive when you play it. Sometimes I think about looking for an Atari setup again. I used to have an 800XL and then a 130XE and I must admit I really miss em.

Regards,

Jim

4662. Atari Portfolio Memory Cards

Newsgroup: comp.sys.atari.8bit

I can't remember where the interview was done, could have been a MAT*RAT
ANALOG interview or something along those lines.

Foggy memory, but Sparta DOS and USDoubler did not start out to be what they
ended up being. IIRC they started out building a disk copy type system like
Happy, then changed their focus.

Could be because the high bidder is a mental case.

Do a Deja News search with him as the author to find numerous psychotic rants. Steven King did a book about him and it was made into a movie. Kathie Bates played Fortran and James Cann played Lord British in the movie.

burns are more than stains, especially in plastics; they actually melt = alter = destroy part of the material and cannot be cleaned in the normal sense. Your only two real options are cover up with stickers or reconstruction with putty and paint like an auto body shop. I don't have any experience with that magic infomercial stuff which is 'guaranteed' to mend leather and plastic while matching ANY color....

-Ron

I don't have a solution but I admire the problem.

So I guess you could have the situation that Doug actually intended
green (if that's what is in the color register), but the people who
wrote the manual saw NTSC blue and documented it that way.

To get to the bottom of this mystery of course would be to find Doug
Neubauer and ask him what the hell colors he intended (if he even
remembers).

Anybody know where he's at nowadays? We should give him a call <g>

Hello All,

I'm Baaack, time for more jokes about how young I am, and how old you all are hehe

No, I did not dissapear off the face of the planet, I am back. 'tis that awful thing called "work" that made me dissapear for about a month or so. I am mad at myself, i have missed some good posts I am sure, ah well. BTW, I can't help but ask a little question here:

Any advice on a new printer for my Atari system? My 1027 is shot, so it seems, as in it does not work right now. I would like to get a new one since schooltime is coming up and I am getting sick of staring into the "screen of death" to type a term paper. The bluescreen atari word processor is a lot more pleasing to the eyes than lotus.

Anyway, any comments or help is much appreciated.

I have dissassembled the usd rom and found an undocumented feature.
Using the special format command, One can format any number of tracks
from 1 to 40.
What use this is to any one is beyond me but it is there. The sector
skew (layout) can be also anything that you desire with the same
command.

Any "Epson-compatible" dot-matrix, especially 9-pin models, are perfect
for most 8-bit Atari applications. With a bit of tweaking, you can also
use older inkjet printers (I set up a DeskJet 500 for PaperClip).

You will, of course, need a printer interface of some sort but getting
one allows you to use printers that produce far better quality output
than anything Atari ever sold for the 8-bit line.

Maybe a cheaper option is to use SIO2PC and your PC's printer.

Chances are you won't be able to..The stain normally sinks into the tiniest cracks and texture of the surface in the same way glue bongs two items.

You could try a foam cleanser (not a polish) and spraying a bit and leaving it to soak on it for a min or so but I doubt it will get rid of all the stain.

With SIO2PC you can enable "Print through" which will divert your Atari's
P1: output to the PC printer or a PC disk file. You can also enable
ATASCII to ASCII EOL conversion and/or TAB conversion.

I think it is "f". The percom data is first, then the sector layout
for the track is next. in one datablock. The enhanced format would
have extra sectors so the datablock would be longer. The drive looks
and uses the number of tracks in the percom datablock. The tracks
start at 1 and step in the number of times specafied in the percom
block.

Have you ever seen the MegaJoy II? It is an N64 controller that you plug into a tv and it allows you to play 60 NES games. You can see it at http://www.onehitwonders.com/mj.html. If Hasbro was cool they would release a similar device that plays 2600 games.

Only thing I didn't like about that printer was that it is nieh impossible
to find a replacement ribbon/cartridge for it. Found something close at a
office store, but didn't quite cut it.

Personally, I think the 1025 is the best for beig a work horse and the
availability of ribbons. Now I just need to find some tractor feed paper. :)

Hmmm, I understand now. You were performing the ancient bardic "data
recovery" ritual that many a programmer has performed when things go wrong with
a computer.
However, this ritual, if I remember correctly, this requires incense
scents extracted from burning melon paper, burned atop two floppy disks that
are placed atop one another to make "Star of David" looking shape.

All this while immitating your local computer. In the case of the Atari
you would make the disk data beep sound repeatedly till the data returned. :)

I'm probably a bit to blame. Basically, I had completely taken over all
programming of Spectre for versions 2.64 (I think...) and 3.0. Dave had
basically retired and was just writing ariticles and not involved in the
day-to-day programming. After 3.0, I left to join ICD. Dave basically never
did much more with Spectre after that. I don't think it was in his heart
anymore and the ST/TT market was losing its luster. Dave was planning on his
super-secret HyperWeb project but that never materialized either (it
probably would have taken a large staff of programmers to implement the
system he envisioned).

Well, with your mentality, Atari was dead after Nolan Bushnel sold it to
Time Warner. After all, Atari was little more than a division under Time
Warner.

So if we were to take your definition about "living", the Atari
400/800/xl/xe, 5200, ST/STE/TT, 7800, Lynx & Jaguar were not official "Atari"
items.

The only TRUE Atari item was the Pong arcade units. Right?

Truth be told, "Atari" has existed under multiple owners. Nolan Bushnell,
Time Warner, Jack Tremmell... JTS doesn't count :) ... and now Hasbro.

Hasbro's "Atari" is doing the exact same thing as Time Warner's "Atari".
Time Warner sold "Atari" games (under AtariSoft) to Commodore, TI/99, etc. Now
Hasbro is selling "Atari" games to PC, Playstation, and so forth.

In my opinion, Hasbro is just as much Atari as anyone else.

If I turned in a report with the atari classic font they would notice
something's odd. Though I doubt any of them would recognize it as atari.

I am considering making this game for the Atari 8-bits. However, graphics is not my strong side of development. Can anybody help ? Also need music and the level design for level 34 and up.

Anybody wanna help ? It will be written in assembler and have some neat effects (I hope you would call them neat at least)

Email me, if you can help in any way!

Take Atarian care

That "fixed width" font and probably lack of spell checker, not like it is not impossible to do with an Atari, just in a different program.

Yep, the teachers would just think, "oh, she types it in the old bluescreen WP 6" or something to that extent. As for the font, once I got a "D" on an "A" paper because the printout was in that clunky Atari Font, the teach wanted it in "Times New Roman". Too bad it took a call from my mom to change that ("Her father is typing his novel on the PC"), it is not really fair either way.

Yes, and yes. As long as you don't need to use the second
fire button on the 7800 stick for the game. As a matter of
fact, I bolted 2 2600 sticks onto a stool to act as the
controller for Robotron 2084, and it really works well.

Now matter how many times it changes hands, Atari is Atari, no matter who owns it. It probably will change hands several more times down the road, but AT LEAST the name is still there.

Atari may be "dead" (as in, it is no longer the leager in game consoles, etc) but in no sence are we ever going to get over it, dead or alive. We would not be here if that mentality stood, that if it canges hands it is dead, Atari would have been DOA way too long ago.

That would be neat, esp since my mom is going to kill me if I turn around the TV set in the living room again to swich the box in the back. I think that they should make the device for a Sega since the two controlletrs are interchangeable anyhow.

The joysticks do, I do not know about paddles though. For the ultimate in non handcrushing gameplay, I would look into a Sega controler for your 7800, much more ergonomic.

Actually they do make a device along those lines called the Nomad. It looks like a game gear but it plays genesis games. You can also hook it up to a TV and hook a second controller into it for 2 player games.

Sheesh, how picky can a teacher be? It's already bad enough with double
spaced, 12 font. It's not like everybody owns a computer with Times New
Roman. (although mine has like 5 fonts that look very very similar to it)
Well, that's just my opinion. Oh yeah, i got times new roman, nice font
actually. There's a font somewhere that looks just like the Atari 8-bit
font.

Well, it doesn't help that my deceased printer, the 1027, can only handle one font (due to the text wheel), but I believe that my teacher gave me that grade because he knows that I have a PC (probably due to my job on eBay) and I should use it. Just because it is a newer build of computer doesn't mean it is better. I guess I should look into that inkjet printer...

Too bad all teachers are not like my folks and could care less that the paper has that "dot matrix" look, then again, they teach college, I am still stuck in the hallowed halls of high school.

Apart from having the same staff, premises, product range, continuity etc
etc. It changed owners but still existed as a coroporate entity. Totally
different situation.

> The only TRUE Atari item was the Pong arcade units. Right?
Nope. See above, engage mind in 'not blinded by bias' mode.

> JTS doesn't count :)
Ah, we agree! Sure, Atari has had multiple owners but in each case (until
now) it has had continuity of form. Now it's just a bunch of old patents
and a logo. The staff who designed the cool hardware & software that made
us wet our pants have long since gone. The (existing) hardware has no
place in a modern (commercial) world. Atari was greater than the sum of
it's parts - it meant something special and indeed was something special
but that's all just history and a warm fuzzy feeling everytime we look at
www.atari-history.com!

> In my opinion, Hasbro is just as much Atari as anyone else.
If it works for you, great, I'm happy for you. It doesn't for me. I miss
Atari. In many ways I'm luckier than most in that having had a VCS, 400,
800, 130XE, 520STM, Mega Ste, Falcon, Lynx, Jaguar and a shedload of
peripherals, I was certainly a signed, sealed and delivered Atari
accolyte. Having worshipped from afar, I moved in to writing for various
Atari mags and regularly dealt directly with Atari, met the people (UK lot
mainly), helped test Jaguar games, went to previews of cool stuff
thatnever got released and so on. To sit in an 'private' Atari room at a
trade show with Jeff Minter, the Tramiels (spit) and a bunch of cool
Atari US 'names' was like dying & going to heaven. Hard not being sad
& nerdy and stuttering everytime I had to speak to any of them ;-)

Yo! Greg, Hows the Atari thang going, Keep those Atari's Humming that's
what I say

Where did you get the 1400/1450 from, and are there any more, ps- I'm
looking for all of the instruction booklets for Indus GT and Expander H/w
and o/s disk software for above drive (I believe that there was 3
booklets that came with the GT)

Lastly I have never left the atari scene since 1986, even though i own a
crappy amdk6/2 400 64meg win98pc(Atari always wins hands down)

Yours Atarilly

Assuming you need the second firing button, what joystick can you still get
that can use this feature? There are some 7800 carts that need this
feature, and I'm forced to go back to my less than perfect 7800 joystick.
I've yet to see a truely 7800 compatible joystick.

Is there a mod that can be done to make them so?

I have an Indus GT, complete in carrying case with all docs and disks. IIRC, it came with DOSXL, estate word processor, and spreadsheet and database programs as well. It's in storage right now, but I could get it down. Won't give you the originals, but I could make copies for you if you ask REAL NICE. :-)

Usually one that you convert yourself... The cheap and plentiful NES
Advantage makes an excellent 7800 stick, and you can modify the small
pushbuttons so that they can "lock" the fire buttons (useful for the
throttle on Pole Position and Motor Psycho.)

For anyone new to the Atari 8-bit, reading Antic and Analog is a must. The Antic issues are almost completely on-line. Unfortunately Analog still only has a few issues on-line. You can find out just about anything about the 8-bit Atari's with these two magazines. www.atarimagazines.com and www.cyberroach.com/analog/

very close; it includes a floppy drive CONTROLLER allowing you to attach a generic PC 5.25 (and maybe 3.5?). Sparta and MyDOS can use it in SSSD, SSDD, DSSD, or DSDD. I have a dead one with the CPM software but no dox... Do we KNOW that this one works?

Jennifer,

MS-DOS is what SIO2PC runs under. If you use A.P.E. 98, though, I believe
you can stay in Windows and still print through from your Atari to your PC's
printer.

Actually, MS-DOS wasn't hard for me because I had put some time in on
SpartaDos :-)

I am not really "new" to this, I just never heard of an ATR 8000... And, Antic is bookmarked, I am slowly going though it and printing out articles of interest.

Oh, BTW, it is likely that a keypad would work better than a joystick, especially if you are like me and learned to play a nintendo blindfolded at the age of three, I became thumb dependent and it is so much better than crushing your hands on a joystick... Then again, you may be joy dependent, depends on what you played with in the 80's...

I love people like you. Your attitude toward DOS is shared by many--many who pay me to fix their screwed-up Windows file structures and systems, something that is often most easily done under DOS.

You may opine that DOS sucks but that beats the heck out Windoze which crash. The best one-liner I saw about Windoze was someone's tag-line:

"Mouse has moved! Windows must be re-started for the change to take effect."

Tom wrote "Snapshot" and I followed up with "XL2". In both cases, the operation was "task swapping" as opposed to "multi-tasking"--only one application was running, the other, and its complete 64k environment were stored in extra memory.

Neither required more than 128k; why would you? You have 64k of main address space and only need a little over 62k to store it in extra RAM (2k in the main area is hardware addresses).

Tom went on to produce "SnapHD" which allowed for multiple images using hard drive space while I went back to tweaking XL2 for more speed and trying to come up with a faster RAMdisk.

All of this stuff can be found on Tom's ftp site. Look for "snap*.*", "xl2*.*", and (if you use a SpartaDOS RD) "ramjet.*).

The only true "multi-tasker" (using what seems to be the MS definition of it) for the 8-bit, was Tom's MTOS which allocated time slices to several BASIC programs. That's also on his ftp site ("mtos*.*).

BTW the programs were not "hacks" they were, in Tom's case, 100% original and, in my case, 90% original (I stole the SnapShot concept from Tom, but my implementation in XL2 was completly different).

Hi Fred,

You can buy prototype copies from B&C Atari Sales (www.myatari.com)
and Video61 Atari Sales (www.atarisales.com) When Atari folded, they
sold off the rights to produce these games to B&C and Video61, these two
companies have been working with a lot of older software houses, buying
the rights or receiving rights releases so they can produce cartridge
versions of many older hard to find games.

Curt

The "blue screen of death" is just wonderful, I know. Sometimes I get it for just closing Netscape, other times I get it just for thinking about closing Netscape, or closing anything, in fact.

It hasn't happened much this week, but I will say that none of my Ataris have crashed or froze in the middle of an application. The only time one ever came close was during a power outage (which I beleive can crash everything, haha). I am not denying that it happens, I know many of you have complained about BASIC freezing up while programming, at least it can be restarted without the OS going crazy.

Yea, that ATR 8000 is one kewl box. With a built in Z80 CPU - 64k RAM,
Serial, Parallel and floppie controller. And yes, you could use 3.5 inch
drives with it. (mydos, spartados) I had 2 720k drives and a 360k drive plus
the 1050 on it. and it worked like a charm. One of these days, I'll put the
manual online. When not in CP/M mode the 64k was used as a printer buffer.
And using the cp/m would make the atari a dumb terminal to it. One could
also if one could find one and just get a dumb terminal and plug it in and
use it as a complete CP/M computer.
SWP also made an upgrade option to hook up harddrives and an 8088 chip to
run IBM (MS-DOS) software.

I'm in high skool too, but I am more into the Atari game systems than the computers. Heh, the reason I got my 65XE was because I couldn't find a 5200, and I thought of using my Atari computer as a replacement to a 5200, since the games are similar.

I do believe I've seen a third party joystick for the 7800... It's made by a company called "Suntac.." I think anyways.. I've always seen them in the Sears catalog... I had the one button equivalent for the 2600 and remember them being highly reliable.. however, I've never seen the 7800 version other than the catalog.. I wonder just how rare these joysticks are?

I wish to trade these for more Antics, or other Atari mags...

ANTICS:
1986:
Jun
Jul
May
Aug
Oct (back cover has a rip)

1987:
May (x3)
Mar
Apr (x2)
Oct
Jun
Feb (front cover missing)

If you need any of these, and have more mags to trade, let me know via email.
I would also consider trades of Atari 8bit carts, or 2600 carts.

Aaron

I got one of their joysticks on my desk. Let's see...

The company's called "Suncom Incorporated". The joystick that I have is a "TAC-2"
(Totally-Accurate-Controller(tm)), it's the standard Atari joystick with two
buttons acting as one. I don't about the 7800 version, though.

I'd consider this one of the best joysticks I've seen. Mine has taken quite a
beating over the years, it still works perfectly and has outlived quite a
number of other (not necessarily cheaper) joysticks. It is more like a real
arcade joystick IMHO.

I just remembered that Suncoms "Starfighter" joystick was mentioned in the new
products section of ANALOG issue 23, page 12. Looking at the article it seems
to me that this is the joystick you've seen, since it has two independant fire
buttons.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor & view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want to order and E-Mail me the rest of what you do want to order! To expedite things, include your complete Mailing address so I can figure Shipping/Postage and Handling. I'll be back after the weekend.

So if you don't come see me, I can't save you any money! ;-(

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/
Web info in my Signature attached to the bottom of any of my messages!

4774. 8Bit Emulator for Epoc32 Machines (Psion)

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-04 00:00:00 UTC
From: primenet <doctorx@dallas.net>
Message-ID: <8me96e$4ce$1@nnrp02.primenet.com>
Source record: 42991

Does anyone here have any idea if there is an 8 bit emulator for the psion line of computers? (series 5mx, 7, netbook, etc?)..

I know that Frodo, the c64 emulator was ported because the C source code was available.. anyone have the technical know how to port an atari emulator over?

Mark

This is kinda off topic but I really haven't had hardly any problems with
windows since I upgraded 98 to 98 second edition. I'm not pro-microsoft, but
I'm not anti-microsoft either, and I can admit that 98 SE made my computer
work more reliably than it ever has before. Now I'm trying out windows ME
and so far I'm pretty impressed, if I start having problems I'll go back to
98 SE.

hi!

i have an atari 130xe, and when i turn it on, it has a _green_ screen.
is that normal? all the emulators i have seen have a _blue_ screen.

Do you mean a plain green screen, or the screen is displaying the cursor
in shades of green?

If the former, it's broken.

If the latter, look underneath beside the sticker for a hole in the base
of the computer. Use a jeweller's flat-blade screwdriver, or a proper TV
adjustment tool, to tweak this control.

It adjusts the colour balance. I don't know the proper term for it ;)

hi!

> Do you mean a plain green screen, or the screen is displaying the
cursor
> in shades of green?

it looks like the normal screen of an atari, but it's not blue, it's green. backround is green, the cursor is light green and the border is black. the self test says that everything is okay, and i can run everything (games and so on), and it works.

One newspaper columnist said that ME works very well as a full OEM install, but the upgrade runs into problems. At least, that was his experience. I have the first edition of 98 running on my computer now, and I have a second computer coming in next week with SE on it. It'll take guts, but I think I'd like to upgrade both of them to ME when it is finally released. I've heard good things about its new features.

Actually my first 800 was that way. There's a pot meter inside, which is out
of tune. I don't remember which, but I bet its there on the XL/XE's too.

> is that normal? all the emulators i have seen have a _blue_ screen.

now i just flipped my atari around, and noticed a little screw on the
bottom (next to the sticker which is in the middle). i took a little
screwdriver and twisted that screw a bit to the right. any YES, it
turned blue!

thank you guys, i really thought i have to buy a new atari :(

While we're on the subject, other video problems are often the result of a failing part in the power supply. That is normally the best place to start looking before assuming the computer is on its last legs. (Atari made great computers but the DC power supplies all, in Jessica's words, "suck".)

If you ever have to replace one, make sure you cut off and save the cable that goes from the supply to the computer as the DIN plug and wire can be used with another supply. If you have such a wire, a quick test of the PS is to hook the wire with the white stripe to the red one on a PC disk drive plug and the black to one of the black ones on the PC. If that fixes the Atari, you know you need a new power supply.

One of my friends (ex-Atarian) runs a small business using an IBM
Aptiva P166 and a P200 laptop. He was just about to blow three to
four kilobucks on a new Pentium-based beasty for production of advertising
videos when I convinced him to have a look at the Mac.

For about half what he would have paid for the new Windoze box, he's
up and running (with the world's ugliest computer :) a great little IMac
with an incredibly stable OS.

This post is for those Atari 8 bit enthusiasts in the Central Flordia area. I have a collection of Atari gear, software, documentation and magazines that I need to find a home for. I really don't want to dump the stuff at a thrift shop and I don't want to hassle with selling it. If anyone in the area is interested in taking this stuff off my hands please email and we'll discuss it. Thanks!

"John K. Picken" wrote:
(Atari made great computers but the DC power supplies all, in Jessica's
words, "suck".)

Yea, pretty much... I have a big box full of croaked power supplies, most of
them 2600's, can be replaced by a nintendo supply, or just go to Radio Shack
and say "Do you have one of these?,": and you will be directed to the correct
part; just don't do it with a computer supply, they are running on slim
pickins these days.

Another piece of advice: Sometimes a cable splice works. Don't ask me why...
it worked a few times on various cables, just don't do it unless you mind
having a short cable (make sure you have an arsenal of extension cables and
power strips at your disposal, I think that goes unsaid for anything other
than an iMac).

Jessica

If you ever have to replace one, make sure you cut off and save the

Ok, I can get this thing to load up a rom, with sound. But, I can't get good controls. If I use my Sidewinder, button A is the 5200 button 1, but nothing does button 2. If I use a keyboard, NOTHING works for buttons.

I read the damn help file 10 times and see no mention of 5200 buttons. What am I missing? Please Help!

I am trying again! I am in good process of making Box World for the Atari 8-bit. I am not a graphics artist or musician. Could anybody help out please ? Also levels 34 and up are unknown to me (I am not good enough to play through the whole thing :-()

Anybody can draw me a figure, box, wall, floor ? Make some nice tunes ?

4797. Atari Trade? 2600 Gremlins and much more!

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-05 00:00:00 UTC
From: Satcom2 <svenhard@primenet.com>
Message-ID: <8mgjip$l9h$1@nnrp02.primenet.com>
Source record: 43114
Cross-posted to: alt.atari.2600.vcs,alt.games.video.classic,comp.sys.atari.8bit,rec.games.video.classic

95% of my stuff is in TOP NOTCH condition, the rest is close enough, nothing is ratty at all!

Serious trades only, no inquiries unless you really feel a good heavy trade may be in order after reading this whole post.

I have Gremlins, a nice Pitfall II,Eggomania, Fathom (loose), Laser Gates,Cosmic Commuter w/manual and Quest for Quintana Roo with manual for Atari 2600. Also a Fathom complete in box, opened, but like new.

Colecovision Slurpy! (nice label, some glue darkening, looks pretty good though still)

Power Lords like mint loose for Odyssey 2!!!

Dracula X!!! for Turbo CD (import) nearly perfect surface on disc in original case with manual (some wear on manual)

Nichibutsu Arcade Classics (Crazy Climber, Moon Cresta, Frisky Tom) for Super Nintendo mint complete in box(import)

Airball loose and Star Wars Return of the Jedi (shrinkwrapped)for Atari 800xl, Diner and Ladybug for Intellivision.

Impossible Mission w/manual and Commando loose for 7800,Beamrider for 5200, Burgertime for Colecovision, and Gauntlet and Rampage shrinkwrapped for Lynx. That is all my stuff for trade.

Here are the games etc. I want:

Atari 2600 King Kong, Adventure box, Private Eye manual, Megamania NO SPOTS on label at all,Custer's Revenge, Spikes Peak/Ghost Manor w/manual, Intellivision Thunder Castle complete,Atari 800xl Mountain King ,Star Wars:Arcade, Super Zaxxon, Choplifter (newer XE style version), Intellivision Super Cobra, Tutankham, Turbo, River Raid, Vectron (NO spotting, purple label). Also need a like mint (no paint wear) 6-switch Atari 2600, no box needed.

Nintendo NES Bonk with box and manual, loose OK too.

Atari 7800 Mean 18, Alien Brigade, Atari 5200 Bounty Bob Strikes Back

If you really impress me I may even let go of my Boxed like new (opened) Lemmings for Lynx, Colecovision Mr. Do's Castle mint in box complete, Atari Jaguar Aircars SHRINKWRAPPED unopened or my Hypnotic Lands Atari XE cart with manual/leaflet! (all pushing $60-$100 or more in Ebay value)

Heavy stuff for heavy stuff only! I know my Dracula X would easily go for $150 on Ebay, and the Nichibutsu Arcade for SNES would get at least $75, not to mention Power Lords for Odyssey 2 in near mint has to be $100 plus, but if you have a lot of heavy stuff I need, especially Super Zaxxon cart for Atari computers and Mean 18 for 7800 I may trade one or more of these, but I would prefer to have many smaller things on my wants fulfilled before I let go of many things on my trade list. Cash mixed in with trade may be OK too. I am offering some of the best for some of the best here!Thanks! -Satcom2

Short-term memory loss? I think I heard that expression once, but I just
can't remember what it means :)

At any rate, you've spoken about stable OSs. I posed the question of how
Linux stays stable, and most people agree that the stability really depends
on setting up custom kernels for each installation. In the case of Mac OS,
I have heard that stability hinges on the rather finite variety of hardware
on which it will run.

Considering the almost infinite variety of hardware on which Windoze is
expected to run, I think M$ has done something rather remarkable -- even if
Windoze crashes more often than most of us would like.

I have a working XE/GS system for sale or trade.

The set includes the XE/GS system unit, keyboard, light gun, power supply, and three cartridges: Bug Hunt (light gun game), Flight Simulator II, and Pac Man.

All items are in excellent condition, tested, and working.

Please reply to themaverick@volcano.net if interested. I would prefer to swap this for a bundle of 8-bit carts, otherwise make me an offer. Thanks!

I had been trying to locate an R-Handler that would drive the modem
which is connected to the 850 on my Atari 800 (64k).

I tried all the ones I could find but unfortunately none have worked.
I tried ATARISRS.232 and the one that is created by AUTO850, and
RVERTER. No dice.

They just won't drive the modem. That is bizarre, because I have a
Telelink cartridge from 1978 or whenever which DOES drive the modem.

I tried the R-Handlers with a variety of telecom software. Bobterm,
Ice-T, and TCPTest. I really believe I did everything right, they just
don't work. Sob!

If anyone has any R-Handlers known to work with the 850, please email
them to me. The only thing I can think of is to somehow rip the
R-Handler code out of the Telelink cartridge.

4802. Classic Computer/Video Game Garage Sale?

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-05 00:00:00 UTC
From: Mike Szewczyk <szewczykm@hcgi.com>
Message-ID: <qmZi5.1430$_x3.33727@nntp0.chicago.il.ameritech.net>
Source record: 43119
Cross-posted to: comp.sys.apple2,comp.sys.atari.8bit,comp.sys.cbm,rec.games.video.classic

I've decided that there are plenty of people who are creating very nice old computer museums and that I'll probably never have the time, drive, or resources to do the same.

I plan on keeping 2 or 3 old systems that I'm really fond of but I'd like to get rid of the rest of my stuff. However, I'd like it to go to a good home so I'm wondering if [during my garage sale of other stuff] I were to put out my classic computers and video games for very reasonable prices if I'd attract any kind of a crowd?

I live in Crystal Lake, Illinois (Northern Illinois).

I dont plan on selling the stuff for collectors prices. All I'm really looking for is to get back what I paid for the stuff and I rarely ever paid more than $10 for anything.

A friend will have some Atari, Intellivision, Odessy, Colecovision games and other miscelleny out as well, I don't know what he'll be asking but he's reasonable and typically agrees with me regarding prices for things.

Here's a list of stuff that I'll have out:

Commodore 64 and Vic 20 hardware and software
Atari 8-bit hardware and software
Apple IIe/c Hardware
TI-99 stuff (a couple of systems are really nice and in the box
I have a TRS-80 Model 4 (I think)
Timex Synclair
Some old HP system

95% of it works.

Any interest??

I'd welcome an offer to take the whole lot as well.

It's hard to say. There might be one collector in your area that would buy
your whole collection, or there might be many collectors that already have

the machines that you have listed, thus wouldn't buy any of it. The only way to know for sure is to post it, and see what happens. Then, if no one buys the stuff, then you could contact a used computer shop, or sell it on ebay. There's always someone who will buy your stuff, the trick is finding them, and being willing to make a deal.

It's really hit or miss though.

What Apple II hardware do you have?

Ernest

4805. Senator GOES GREEN, will Vote Nader.

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-05 00:00:00 UTC

It's hard for me to believe that the next president of the United States will be George W. Bush or Al Gore. Both remind me of Hollywood movies that have been focus-grouped to death: they push all the appropriate buttons, but have zero original vision. Both stand for the same thing: corporate-driven business as usual.

There must be some way outta here.

Ralph Nader is no joker or thief. I think he and the Greens could give Al & George a good run for their money. At 65, Nader isn't running as fast as he used to, and the Green Party doesn't exactly have its platform figured out, but I think they have what it takes to inject a dose of radical democracy into the race. Unlike the two Tweedles, Nader is real, he stands for decency and common sense and he still commands a lot of respect in progressive and activist circles. And hidden behind the rainbow coalition of lefties, eco-feminists and crazies, the Green Party does have some great ideas. It's the only party that stands for the Tobin Tax, true cost markets, media reform and putting corporations in their place.

In October, with a fired-up Nader hurling intelligent sound bites into the presidential debates, the whole game show might actually be worth watching. The alternative is the most sophomoric presidential race in American history . . . and the lowest voter turnout ever.

I'm putting a GO GREEN - VOTE NADER graphic at the end of all my emails from now on. I'm betting that, between now and November, the American people will wake up to the fact that their sacred democratic experiment has now degenerated into a choice between a corporate-sponsored Republican and a corporate-sponsored Democrat.

In these heady post-WTO days, a sudden, massive protest vote against Al & George is entirely possible and Nader would be the most apparent heir. With perhaps less than 25 percent of the people voting, an inspired Nader campaign could grab a surprising share of the action. And even if he does not come close to winning, at least imagine how his campaign might pull together some of the fired-up, post-WTO forces and lay the groundwork for something really visionary in 2004.

Download the graphics and help launch an email pyramid scheme to dump the Tweedles! Two formats are available, a magazine

sticker (17K) or a Banner ad (5K):

==========

What it Means to be Green

"At the root of all Green political action is nonviolence, starting with how we live our lives, taking small, unilateral steps toward peace in everything we do. Green politics requires us to be both tender and subversive. Affirming tenderness as a political value is already subversive. In Green politics, we practice tenderness in relations with others; in caring for ideas, art, language, and culture; and in cherishing and protecting the Earth. To think Green is to build solidarity with those working for social justice and human rights everywhere, not bound by ideologies."

-Petra Kelly

I picked up a pair of NES styled 7800 joypads on eBay awhile ago. They're not great controllers but are a least a step up from the almost unusable 7800 standard joysticks. I use the pads for all of the games that require two buttons. For one button games and 2600 carts I use my old reliable 2600 sticks.

50 IF PEEK(764)<255 THEN GET #1,C:PUT #2,C:? CHR$(C);
60 GOTO 40
```

Do you get any errors on opening devices? Can you get as far as typing
AT<RETURN>
and getting an "OK" from the modem?

May have to jump through a hoop or two. Something like plug the modem into
an IBM and set it up for 300 baud first. But Atari BASIC will run that at
300 BAUD w/o a problem and Turbo Basic will probably do 1200 BAUD.

First off, this is not an American newsgroup--most of us couldn't care less who becomes the next president of the excited states.

Second, spamming usually produces negative results as the _real_ users of a newsgroup transfer their resentment to the product or person you're trying to sell.

Go post in some place like alt.politicians.suck.

Even the ST serial ports max out at 19200 so there's not much point in
using anything better than a 14k4.

The major problem you'd face, after the hardware stuff, is software. The
vast majority of 8-bit software that uses extra RAM assumes 130XE
compatibility i.e. RAM/ROM is controlled via PORTB. On the 800, PORTB
is used for joysticks and, depending on the upgrade, various other
addresses are used for RAM control.

In the long run, if you want a large RAM A8, you're better off with
an XE or XL. If you stick with the 800, about the only software that will
utilize the extra RAM is MYDOS 4.5+.

If the burn is not too deep you may be able to get away with lightly sanding off the top layer of plastic on your case. Of course this will leave a smooth area in the plastic's original color. If your Atari has yellowed a bit over the years this could be as a big of an eye sore as the the burn.

> Steve B.
>

Somewhat off-topic for the A8 newsgroup however:

1. Download PKZIP250.EXE and run it to extract the files. Version
2.04 will also work but does not include support for long filenames.

2. Make sure that PKZIP, PKZIPFIX, and PKUNZIP are in your path
(maybe stick them in C:\WINDOWS\COMMAND).

3. Go to the MS-DOS prompt in Windoze (it is not necessary to
restart the computer in DOS mode).

4. Change to the directory into which you want the files to be
extracted i.e. "CD \[path]\[targetdir]"

5. Enter "PKUNZIP C:\[sourcepath]*"

6. PKUNZIP will extract all files with a ".ZIP" extender to the
directory you're currently in.

7. Enter "EXIT" to return to (ugh) Windoze.

I don't know of any Windoze utilities that are simpler (Windoze look
pretty, but DOS works).

Yes to the XL and yes to the modem. The modem will require an interface
and the choice is critical if you want the best performance from the
modem. The Atari 850 max's out at 4800 baud; some P:R: connectors will
work well at 9600 (the one I had did--others don't; trial and error here).
If you want 19k2, you'll need a Black Box or MIO.

Who is it? I quote 'I don't know the solution, but I admire the problem'.
I don't think it is your handler (the 88 byte one).
Since it works with Telelink, there is something about BobTerm/IceT
that you're not configuring correctly, would be my guess.
Be sure to set ASCII translation (not ATASCII). And half duplex.
And 4800 baud. I can tell you if BobTerm comes up ok, then the
R: handler is there, otherwise BobTerm will tell you there isn't a working
R: handler.
BUT. I do have a collection of about 2 dozen R:/T: handlers. I've picked
out 9 that I think work with the 850.
Good Luck.

Hello, I recently found an Atari 1200XL, and I'm not sure if it is working. When I connect it to a TV, I get a blank blue screen (which I have found changes color with a potentiometer on the top of the motherboard). No prompt, no nothing. When I insert a cartridge I get the same screen. Is it broken or do I need to hit some key combination? If it is broken, is this easily fixable (I can do some soldering)?

Thanks
Tony Nelson

It's broken. Sounds to me like the OS ROMs could be lose or missing,
usually a dead XL will give you a green or red screen to report a fault,
and a cartridge should work directly.

An 850 is what I have (finally, after long months searching) but a 14.4K modem is a lot easier to find than an interface, 4800 baud is better than nothing and will be suitable for now, but I would really like to get up to the whole 14.4K. Give me some suggestions as to types of interfaces to look for ("black box" is kind of vague but I do know what you are refering to).

Try soldering a few connections (I wish I knew which to do, I have yet to crack mine open to do any work but I am sure somebody here can help you), the prompt you should get when you boot up the 1200 XL without a cart is just a black screen with a colorful Atari logo.

I can sympathize with the blue screen after the cartridge is inserted, I mean, you really have to shove those in to get any response, same for the peripheral ports. You may want to alter them as well but I think it is a common problem with the 1200 XL, so are video problems.

I had a 1200XL for a while. Bought it for $199 a year or two after it
came out and the 600/800XL obsoleted it.

I thought the thing was great. I had almost no unresolvable problems
with software or peripherals, and the keyboard was to die for.

Wish I still had it (and the 100+ games I sold with it for $50 back
around 1987). Story of our lives, I guess... *sigh*

Yeah, I know the feeling, half of my family passed on their 2600 units around 1990 or earlier for $10 and the arsenal of games they had. Ten years later, the wood grain ghost is haunting them in the night and the sudden urge for the 2600 is killing them.

As for the 1200 XL, I paid $5 for mine on eBay in a $60 "whack" of Atari computers...kinda makes you feel bad when you dished out so much so many years ago for the same shebang.

The 1200XL does not have BASIC built in, so it normally comes up to a blue
screen followed by an Atari Rainbow effect.

That it gets as far as initiallizing the blue screen is a good sign.
Standard advice is to leave it on overnight and then restart it. Moisture,
sloppy connections that jiggle when it goes through a good thermal cycle,
that kind of stuff.

IMO: Worse case is a bad RAM chip and they are all socketted. Everything
else like the custom chips is probably working fine. You can stick a 256k
dram in there if you can't find a 64k.

I had some luck with this after going back and forth for a while. I
noticed that some of my BobTerm configurations were lighting the modem
LEDs. It seems like they just were not juicing it enough to dial. I
changed the modem for another, and it finally worked!

I can dial out with BobTerm now. Woohoo at a zinging 9600 baud!

Thanks for all the handlers! You have more handlers than anywhere I
could find on the Internet.

AFIK PKWare's implementation of unzip always extracts to the current
directory. PKUNZJR will let you specify a target directory but it lacks
much of the power in PKUNZIP.

About the only noticeable difference in 2.50 from 2.04 is reputed support
for long file names. ("Reputed" 'cause I haven't tried it--I stick to
8.3 file names).

Generally speaking, no. .xfd (and .dcm, .atr, .scp) are disk image files designed to either be used as an emulated disk drive or extracted to reproduce a disk.

You can convert a .xfd to a real disk and thereby access the files on (in) it. A .xfd is simply an image of the data sectors on a 5.25" floppy, usually Atari single density (18 sectors/track * 40 tracks * 128 bytes/sector = 90K).

You cannot rip the code out of Telelink because it's not in there. It is downloaded from firmware ROM located inside the 850 when you boot the computer without a disk drive (as is the case with Telelink) or when a special handler is invoked. This handler is a tiny (1 sector) file that, when run, merely calls the 850 and loads in the handler from it. You can find it in many places, even on the Ice-T disk (rename it to RS232.COM before loading Ice-T).

When you boot up Telelink, a brief series of long beeps is heard at boot time. That beep is the handler loading. When loading the handler from DOS that beep should also be audible as an indication that the R: handler is loading and available (it's different from the disk drive's beep).

Hope this helps,

-itay

I have an IceT disk, but the only 1 sector file on it is ICET.CFG. I
renamed it as you said, but got an error when I renamed it to
RS232.COM and ran it. Error 180 or 136 I think.

Maybe I don't have the latest IceT disk. I will get the one off your
IceT page, and try that.

Thanks for the info!

I like Sega controlers, they are nice and comftortable and seem to work well, I find Nintendo controlers to be handcrushing anymore, I guess I am getting spoiled. But, anything is better than a 2600 joy if you are going to be playing for several hours at a time (like a night fest).

4834. Beefing up an Atari

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-06 00:00:00 UTC
From: Jessica C <beadsandbangles@earthlink.net>
Message-ID: <398CE924.CE9FD883@earthlink.net>
Source record: 43132

I am looking to beef up my Atari 800 (first love) with an expanded memory, etc. What I need to know is:

1: How much memory can I add to my 800 (I would love to add a TB to it but a few more K will be OK)?

2: Where can I get instructions for the project?

3: What is the fastest modem that I can hook up (can I hook up a 56K modem or would that be too much?)?

4: Can I take out the RAM carts and just replace the whole RAM system with non modular boards (as in, It takes a soldering iron to expand)?

The thought just crossed my mind as a cool thing to do. Any input and suggestions are appreciated.

Jessica

> Here's a list of stuff that I'll have out:
>
> I have a TRS-80 Model 4 (I think)

You might mention the Model 4 in the TRS-80 newsgroup, someone there will likely make you a decent offer. The problem with selling classic computers at a garage sale is getting visibility to those few people who would be interested. I did see a garage sale locally that mentioned a Mac Color Classic among the items. I rushed over, but it was gone- someone else had also seen the ad and come specifically for it. So you might list some of the more attractive items in your ad.

Hello Everyone,

I am looking for the rare Atari 5200 Asteroids
game cartridge to complete my collection.

I know it was issued, because I saw it in a
display case of the videogame department of
one store, when the Atari 5200 SuperSystem
was first released.

Welcome to the comp.sys.atari.8bit newsgroup!

Atari 8-Bit Computers

Vendors and Developers List

"A comprehensive list of vendors, developers, publishers,
and repair shops for Atari 8-bit computers and their users"

Additions/suggestions/comments/corrections are needed! Please send to:

Michael Current
mailto:mcurrent@carleton.edu

Please refer to the latest version of this FAQ list whenever possible!

Available via these locations and Usenet FAQ archives everywhere:

http://www.faqs.org/faqs/atari-8-bit/vendev/

ftp://rtfm.mit.edu/pub/faqs/atari-8-bit/vendev

news:comp.sys.atari.8bit news:comp.answers news:news.answers

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
developer. No prices are given.
```

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection. Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.
"Hi!" to Alex Martin, who has done the same for the land of Poland.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

4839. AURA menus now online

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-06 00:00:00 UTC
From: "Mr.Bacardi" <mr.bacardi@freenet.de>
Message-ID: <398D333A.91EDA2CB@freenet.de>
Source record: 43137

Hi !
All "The Grim Reaper" disk mags and some A.U.R.A. menus are now online !

Just surf by : http://people.freenet.de/mrbacardi/
Btw. I'm looking for missing A.U.R.A. menus !
Bye

4840. Re: 'Tis Good to Be Back

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-06 00:00:00 UTC
From: Alan Sharkis <asharkis@erols.com>
Message-ID: <8mjk63mt1@bob.news.rcn.net>
Source record: 43138

John,

I have an email on my desk of a conversation between Abbott and Costello. They're trying to learn to speak Hebrew. It's meaningless unless you have some background in conversational Hebrew. Mine is very weak, but sufficient to have me ROTFL. The conversation between them, in the same vein as "Who's On First," is really quite funny. I guess that's sort of the direction in which this thread is going.

Now, about this thread, and what we're talking about -- as I understand it, you made a comment about the relative stability of Mac OS and I answered that. Jessica interjected a comment that her father is always complaining about whatever I commented. Then, she wisely stated that the whole thread is off-topic, which it is.

Now, who's on first?

<VBG!>

Alan

> but a few more K will be OK)?

I can sell you 2 boards that can make an 800 look like a 130xe with
out the seperate antic bank switching. ie 16k under the rom and 64k
extra ram.The os is a modifyed rev B 800. If you want a modifyed 800xl
one, I must do extra work and testing. It can be switichable back to
a normal 800 or an 800 with axlon compatiable 240k ramdisk

>
> 2: Where can I get instructions for the project?
no instructions. read above

>
> 3: What is the fastest modem that I can hook up (can I hook up a 56K
> modem or would that be too much?)?
A faster one running at 19200

>
> 4: Can I take out the RAM carts and just replace the whole RAM system
> with non modular boards (as in, It takes a soldering iron to expand)?
The boards will require soldering. Both are plugin into the orignals.
The ram card one requires modifaction first. The os board requires a
couple of chips to be removed and a couple of wires to be soldered.
Better I send you the boards complete.

SDX can use the axalon ramdisk. So can superdos and sparta 1.1.

4843. zip utility

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-06 00:00:00 UTC
From: Steve Breech <sbreech@columbus.rr.com>
Message-ID: <16gj5.8298$IX6.59086@typhoon.columbus.rr.com>
Source record: 43141

Is there a way to unzip all zip files in one directory into another directory with a single command (on a windows machine....all my .atr files are zipped up) into another directory? I loathe unzipping each one individually, since I have around 1000, including all my ST downloads and c64 downloads....
Thanks!
Steve B.

Uh, we were on the subject of SIO2PC and my lack of MS DOS knowledge, I think. Originaly, we were discussing printers.

So, you are saying that I should probably stick with my 1200 XL. Agreed, but I just thought it would be kinda neat, but I will look into the 14.4K modem, 300 baud is driving me nuts, though all the local bbs' I get onto accept it, just takes all night to get anywhere... thanks...

Again, the video problem (fixed by leaving on overnight), I forgot to mention that, thanks Rick. If you want to ensure not having to do this again, I would suggest doing a search on Atari 800 or a similar query and get insructions for resoldering the joints. You may also want to open up the computer and give it a good dusting with a thick lint free cloth just to keep the unit clean. About 70% of the time, a dusty computer is causing the problems, but it never hurts to ask about the possibilities.

No, I don't think so, I get a lot of really strange items around here at the second hand shops (like a really souped up 810 that can do DD) but I think that this cartridge was a 5200, color label/graphics, etc. Well, who knows, it may just be my imagination, but I doubt it (unless they made some 2600 and 7800 games with ROM ports on the lengthwise side, again, I am doubtful...)

4851. Big Atari 8bit IRC Chat on Tuesday Night

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-07 00:00:00 UTC
From: NOSvelcro@netunlimited.netPAM
Message-ID: <398e187a.9616890@news.netunlimited.net>
Source record: 42918

This announces an IRC chat for Atari 8bit enthusiasts. It is scheduled for August 8th, 2000, 10:30 pm Eastern US time. Here are the corresponding times for some other places, choose the one near you.

California: 7:30 pm. Colorado 8:30 pm. Texas 9:30 pm. London, England: 4:30 AM. Berlin: 5:30 AM. Hong Kong: 11:30 AM.

The topic for the chat will be "Atari 8bits on the Internet." General Atari8 chat is also welcome. If 7 people show up, I will provide a doorprize.

This will be a standard IRC chat. It is -not- a web-based chat on your browser. You need an IRC client, such as mIRC. The chat will be on Amiganet. Here are some servers that will get you there:

irc.whiterose.net
thule.no.amiganet.org
linux.us.amiganet.org
au, uk, se, no & us.amiganet.org

Once you log onto a server type "/join #atari8" and we will be there waiting for you I hope!

When you do find something in KY, you find the weirdest things... You may not live in the wrong area (well, maybe you do?) you ju8st probably are not looking in the right places. Like for example, I had to dig through a pile of 8 tracks to find my souped up 810 and then I had to negotiate the price since it was sans a price tag...

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

Yep exactly right. here is part of the text.

Any advice on a new printer for my Atari system? My 1027 is shot, so
it
seems, as in it does not work right now. I would like to get a new
one
since schooltime is coming up and I am getting sick of staring into
the
"screen of death" to type a term paper. The bluescreen atari word
processor is a lot more pleasing to the eyes than lotus.

What's on second!

You might wanna check out the small ads at the ABBUC site.
www.atari-computer.de/abbuc. then click on INSERAT.

Or come the the JHV of the ABBUC on Oktober 28th 2000, at the Buergerhaus-Sued
in Herten, Germany.

Try Diskformer (if you wanna do it on an 8 bit Atari). I believe I've seen it
on the net, but can't remember where.

An ATR 800 is worth a lot right now, about $50 on eBay (with or without the disk drive, ususally the 800 crowd has an arseanal of drives or has no idea how to use one), due to a sudden resurgence of interest in the unit. The 810, it can go for anywhere between $5-35 depending on the time of day, pretty much. The 800 XL might get you $10, they are very common and everyone is trying to get rid of thiers on a unsuspecting market (now is the time to buy!). The 1050 will bring about $10-$30, once again depending on the time of day.

Thanks,
Jessica

I am a lousy artist, but really want to convert the Box World game to the Atari 8-bit computers. I do need graphics, simple graphics in 3 colours, 16*16 of a man, preferably animated, boxes, floors, walls. That's about it in the graphics department. I also would like to get a few nice tunes, Chaos Music Composer is good, that will run fine on NTSC and PAL machines. Last, I need the level design for level 33 and up.

Anybody want to help out here ?

Take Atarian care

Tramiel for President? Good God... he'd start off making all kinds of promises, then fail to deliver them. Instead, he'd work on all these great policies and bills and then offer them up to the public with little to no fanfare or publicity, resulting in them being completely ignored because no one knows about them, which would be a shame because they really are great policies and bills. Finally, after years of this, the US would perform a reverse merger with Cuba before the whole mess finally falls apart and Canada picks up the bits of the US that are worth salvaging and selling the rest off to third world nations. :-)

Mind you, if Bushnell became president, it'd be free pizza for everyone...

>.exe format. Thus making it workable on a real atari 8 bit?

I hate to disagree with jkp on this... You can do just about anything with an .XFD that you can with an actual diskette; it is just the same data in a different form.

There are utilities which can extract files from an .XFD just like it was an archive. Now, if it has been made into a 'boot' .XFD, then you have the same challenge as converting any boot disk into an .EXE file; this process can be somewhat tedious and complicated.
good luck;

Does anyone know if the author of Atari800Win is aware of
(or working on) the situation when blues appear as green:
Star Raiders shields
Star League Baseball sky
NYC The big apple - sky on intro screen

Don't think I'm unappreciative of the work on the FREE
product, but I would like to this fixed if possible.

We had a giant thread on here about a week or so ago in regards to the Star Raiders shields problem (Original VS Emulation). YES, we are aware! Perhaps we can fill you in on some ways to repair this problem. I think the author is working on it (I THINK? Perhaps he should speak for himself) and in the meantime you may need to adjust your color settings.

Well, what about making an .xfd into an ATR? I would settle for using the file in Atari 800 win. I'm just not that familiar with the .xfd format. I thought it was created for use by PC-X-former, one of the first emulators and it differed from its .exe counterpart by the addition of a few bytes appended at the end of the file, which is what allowed the emulator to recognize it as an atari file.

> What am I missing? Please Help!

To be perfectly honest, I don't even bother to play 5200 games on
Atari800Win. It seems the emulator is only set to use only that one
fire button which most games only need. But trying to get the 5200
BIOS and the games to work? Forget it...

Right now the best 5200 emu is VSS by Dan Boris. But you're really
better off finding the Glenn 5200 Man hacks and playing them on
Atari800 since there's no graphic glitches or anything.

Yep, that is a snap some utilities found on the web.
The file differences are just the reverse of what you describe. The .XFD is a 'raw' data file which contains the sequential bytes of 720 - 128 byte (for Single Density) sectors for a total size of 92160 which XFormer is programmed to manipulate. Data from sector 1 begins at byte zero (0), sector 2 at byte 128, etc. Early XFormers could even handle 184320 byte SSDD images, but XFormer 2000 Win95 will not boot one.

The .ATR has 16 information bytes at the beginning to make it a little more flexible; boot disk images can be short if they need fewer than 720 'sectors' or larger mega-sized ones can simulate MyDOS or SpartaDOS hard disk partitions. The 92160 bytes following the 16 byte header are exactly the same as an .XFD.

-Ron

I don't have a solution but I admire the problem.

Thank you everyone for your responses. I realize now what the problem was, or rather my own lack of clarity on the concept sort of speak. To make the story short, setting the .xfd file as a disk image in the emulator will make it load, precisely as explained by the previuos message.

>work, I will let my buddies here clarify that for you.

I'd doubt the XF351 can be used with an HD mechanism without serious
modification - STs of that era need a new drive controller etc, and the
351 is /so/ rare, that anyone hacking it up should be forced to use a
Commodore 16 for the rest of their life.

If the XF351 isn't rare, I want one :)

Hello!

Does anybody know how the touch tablet works? I'm talking about the
principle of the black thing with 6 wires going from it. Not about
programming information.

Hello!

I'm looking for portable unARC sources (any dialect of C would be
ideal). Anybody knows where could I find it?

Don't send me links to binaries, please. I've got them. I need to
incorporate decompression in one of my programs.

I had this exact same question a few months ago. I looked forever for a
Win32 app that would unzip multiple zip files and never found one. I didn't
like pkunzip at first but after using it several times I got the hang of it
and it really isn't that bad.

Sega controllers are nice but for 2600 my favorite joystick is the wico
boss. Its simple and comfortable. Its the joystick I used to get over
150,000 points on Megamania.

Jessica,

IIRC, the mod for the XF551 won't handle 1.44 Meg floppies in the 3.5"
format -- only 720K. It would, I've been told, a complete rewrite of the OS
to get the 1.44. I could be wrong.

Well, so, it would still be a lot easier to save anything if you have a 3.5 disk drive, you know, with the lack of flippies anymore. excuse my ignorance, perhaps the next time I see an XF351, I should buy it. (I think I just cursed myself...)

I don't actually have one, not anymore anyway (the board inside was cracked).
Sorry, though I think I just jinxed myself and I will never see one again.
every time I see something like this, I am usualy broke and cannot buy it or if
there are several, only one. :(

Source record: 42877

FamilyNet HQ: Telnet:\\www.family-bbs.net

Hi gang, currently working on an Atari 810 drive, and I have to say that this drive is most impressive in how it was put together.

There are rubber stopper feet that cover where the screw holes are. Nice touch! Once I removed the stoppers however, I was amazed to discover that my 810 drive didn't have any screws holding it together. Cool!

So what is the proper way to take one apart (as to not damage the casing)?

Once inside, I believe the rails the head slides on may need lubrication. What kind of lubication is good for the 8-bit Atari drives (I actually have several that need it, so might as well ask now).

I will also be cleaning some heads. Of course you have the cleaning disks that do a minor amount of cleaning, but for a good proper cleaning (when taking the drive apart) what would you guys suggest?

Thanks!

Doctor Clu

Having a blast on his Atari 800!

They're great aren't they? I have found that a lot of amiga users consider
the 400/800 computers to be their kin from the distant past, (due to Jay Miner
making the chipsets for the Atari 400/800 and Amiga)

> Where did you get the 1400/1450 from,

Good question. I managed to get my 1400 keyboard from a Radio Shack back
around 1987 or so. They were sold as a keyboard hobbyist kit.

> and are there any more, ps- I'm
> looking for all of the instruction booklets for Indus GT and Expander H/w

Indus are cool. I take it you have a drive?

> Lastly I have never left the atari scene since 1986, even though i own a
> crappy amdk6/2 400 64meg win98pc(Atari always wins hands down)

Like said before, joined in 1981 or so, left about 1989 (though I took my
computer out of storage every so often to play joust and archon on it, and
Return of Heracles with my good friend) Rejoined in 1998 and use an Atari 800
that I leave on as a 24/7 terminal at home for checking E-mail and Newsgroups.

Honestly don't be too quick to insult a good computer. A 400 mhz 64 meg
ram machine is nothing to sneeze at. It's just that an Atari 400/800 has a
soul. ;)

I've never been able to get a 1.44 to work as a 1.44 with my ATR8000. I have heard of people that use a 1.2 meg 5.25" and just format it using the 8" DSDD parameters to get ~1 meg.

I thought the data rates were the same for the 1.2 and 1.44, so it seems like it should work. If anyone has figured this out/jumpers let me know.

I should stuff a 1.2 meg in there since I have one gathering dust, but I already have 4 drives hooked up.

Cannot help here..? never seen that!

>Once inside, I believe the rails the head slides on may need lubrication.
>What kind of lubication is good for the 8-bit Atari drives (I actually have
>several that need it, so might as well ask now).

Avoid oil; it runs off where you do not want it and what sticks eventually gums things up as it oxidizes. I have heard some recommend a light weight teflon grease. I clean the rails thoroughly with a little solvent on a swab; mask off things like the head, and use a spray-on dry silicone lubricant on my personal drives. So far so good but I make no garantees.

>I will also be cleaning some heads. Of course you have the cleaning disks
>that do minor amount of cleaning, but for a good proper cleaning (when taking
>the drive apart) what would you guys suggest?

Those disks can be pretty harsh and abrasive; use preferably the long handle electronic cleaning swabs which have no soluble adhesive on the cotton; standard Q-tips have glue where you do not want it. Use denatured alcohol or 70% isopropyl or 1,1,1 trichloroethylene or other good electronic cleaner or degreasing solvent.

-Ron

I don't have a solution but I admire the problem.

Hello Greg, you can open your Atari 810 by "CAREFULLY" removing the
tan colored disks on the top side of the 810. Note that you may not
be able to put them back but if you pry them off with a needle/pin and
put them on some wax paper while you work you may be able to re-apply
them. Once removed, the four screws holding the case together can be
unscrewed and the top comes off. You may have noticed the top &
bottom of the case are the same so the tan covers are exactly where
the rubber feet are on the other side. Also be careful of the brown
front piece and make sure it is in place before putting the drive back
in the case shell or you can bend the front LED's or switch....good
luck.

From: Darklord <darkspamlord@fiestanet.com>
Message-ID: <PLKk5.11104$H14.16568@newsfeed.slurp.net>
Source record: 42804

I have an Atari 130XE and an 810 drive. I think I have connected these correctly, but I cannot get the drive to boot at powerup. The last time I used this was a LONG time ago, and I didn't hook it up then.

I have connected both power supplies and the cable between the computer and drive. The computer works by itself. I have tried all four possible device switch positions on the drive. I tried both ports on the drive. The drive powers up and runs a little like I remember. I then turn the computer on and there is no action. I also tried this with an 800 computer and I get the same behavior(nothing), so I do not think it is the computer.

Thank you for your time,
Ian A. O'Neil

Well,
ABBUC Floppydoc (Erhard Puetz) once built the HDI (High-Density floppy
interface), that could attach 1-4 Floppy drives to an Atari SIO port.
The floppies could be 5,25" 80Tracks DD (720kbytes, PC or something) or
3,5" DD/HD 80 tracks (720k or 1440k, PC, Amiga, ST, etc.) The interface
was sold out very soon, but you can still find the schematics on his
homepage. Just visit ABBUC:
http://www.atari-computer.de/abbuc
and click on the button "Floppy Alchemie" which will link to Erhards
Homepage (sorry, I do not know the direct URL). Once there try to find
the schematics for the HDI - maybe you can built one yourself... By the
way, the HDI supported single, double and high density (40 or 80 Tracks,
dd or hd, single or double-sided) but no medium/dual density (1050
format). Therefore it supported ultra speed known from happy and speedy
drives...

greetings - Andreas magenheimer

P.S.: There is of course also the Black Box and its Floppy board, that
supports 3,5" floppies and with an XF floppy you could at least reach
720k with a 3,5" drive and a slightly changed OS...

> > --
Hello Richard, Jessica, folks,
you can easily convert your XF551 into an XF351. Just make some 3-4
byte(s) changes in the original Os and hook up a 3,5" drive into its
case. Now, since the XF has an ST floppy controller it can handle up to
720k (originally the ST floppies could merely handle 720k too). Since
the ST`s were upgraded with a 16Mhz Ajax chip to use 1440k, maybe one
can also upgrade the XF with this chip and use HD. But it is a rather
tough and expensive upgrade. why not live with 720k - thats enough for
the little ataris. Or built the HDI interface from erhard Puetz, if you
can... or use a Black Box and floppy board...

You see, 1440k for the little Atari - not really a problem.
greetings - Andreas magenheimer

Hello,
ofcourse an Atari can do that. You just need a converter utility. Mail
me, and I will send you some Atari image converters (to convert ATR and
XFD on an A8).

Ever read something about "batch files" ?? Thats what you need: create a
batchfile on a PC (or even on an atari-8) that does the job... -Andreas

P.S.: For the Atari-8 use Sparta-DOS and Tom Hunt`s unZIP utility. For
the PC, well, who needs a PC for such simple things ...

Hello,
the same is true for me: I do not know Box World at all, besides I am
unable to do sounds or graphics on the A8. But if you need some "ripped"
sounds or graphics, I have the Pooldisk II and other A8 CD`s with
software. They include thousands of pictures (Mic, Pic, etc.) and sounds
(Ams, Amp, Cmc, Mpt, Tmc, etc.). Maybe I can do you some sample copies
on diskette. Just let me know what sort of graphic or sound you need and
I will search for it then. Well, I know, thats not what you expected,
but thats all support I can give...

Hello Steve,
well, you have to built one yourself or buy some extra hardware to use
it.
First, you can upgrade your XF551 easily for 720k. Just change some
bytes in the OS and hook up a 3,5" drive to it. Using 1440k is not
directly possibble, since the XF merely has an ST (DD) floppy
controller. But you can built a more expert upgrade, that uses the 16Mhz
Ajax chip (and some more electronics) and thus works with High density.
If you like the XF floppy drive...

On the other hand you can buy or build a HDI (High Density Interface), a
Black Box with floppy board, an ATR 8000 and maybe other hardware to use
a HD floppy with an A8. Depends on your skills and your money bag... The
Black Box and ATR8000 are not so cheap to get, the HDI and XF upgrade
are not so easy to do...

Good luck, however !! -Andreas

Well,
here in Germany you already have to own an Xf551 drive, then buy a new OS from ABBUC (Hyper-XF from Stefan Dorndorf), install it instead the original OS, then hook up a 3,5" drive to the XF and you have a single XF upgrade (which we call XF351 ignoring that Atari also made some XF351 drives). But, it is something you have to do yourself. Most atari guys are lazy and want a ready-to-run hardware (plug and play/pray in the PC world). But then, you have a 720k XF floppy...

I never tried the HD version of the XF, some guys just told me, you need an Ajax chip and some more electronics to do it. Looks like HD is possibble with the XF, but I never tried nor seen it. In the US there once was (still is ??) CSS that had a single XF upgrade and besides a dual XF upgrade 8where one could still use the 5,25" drive). Maybe they are still selling Atari hardware and you are lucky enough to get such an upgrade. Try Best Electronics, Video 61, B & C to get an XF551 drive...

Lastly, I never used the HDI (owned it for a short time) and never saw the ATR8000 or BB+floppy board with 1,44Mb drives in action. -Andreas

Well, Box World is a cool puzzle game where you push boxes into their right position. The puzzles look simple, but gets really hard after a while. You can only push the boxes and have to look out for trapping them against walls or lock yourself into a small confined space. All I need is a little man, boxes, walls, floors, well that's about it I think. I would like original music and not ripped music, but will have to go with ripped if nothing else happens. I'll probably use Jet Set Willy again (I used it in some of my demos)

I don't like ripped graphics, I would like original ones here too, but I have an offer from someone and hopes he has the time to go through with it.

Greg,
When you get the drive open, you'll see either two or four PC board in it, depending on when it was made. The board on the back bottom with the power connector and the 15-pin serial plug is the power board. To the side of the drive will be either one or two boards. Early 810's had one controller board to the side of the drive mechanism. Later boards had a controller board with a daughterboard, and a data seperator board above the drive mechanism itself. By the way, what are the symptoms for you needing to service the drive, besides it being about old enough to drink....

I use sewing machine oil. I put a drop on a screw driver and transfer
it to the rails.
I have heard of a teflon lub avilable from gun shops is the best. Use
the same procedure to put it on.

>
> I will also be cleaning some heads. Of course you have the cleaning disks
> that do a minor amount of cleaning, but for a good proper cleaning (when taking

The little rubber things on the top are usually gone, then you can get a long screwdriver down in to unscrew the case. I think you will find that the case has a lot of unused space that could have easily been compressed into a smaller drive casing. Good luck servicing,

Jessica

Did you remeber the sequence? Turn on drive, boot up noises, place in disk, close door, turn on computer. That usually works or you could have the problem like I did and have an offline drive. Try the sequence with a commercial disk (they seem to do a good job at startup) and your drive MAY come back to life, it may take a few days and lots of trying to get the drive to work. If this does not work, I would say it needs a good cleaning and perhaps a servicing (hey, if Greg has any luck, we can take the drive to him :-)).

Isn't the XF351 that people have been talking about really XF551? There is no XF351.

Allan

<< Hello Richard,
Jessica, folks,
you can easily convert your XF551 into an XF351. Just make some 3-4 byte(s) changes in the original Os and hook up a 3,5" drive into its case. Now, since the XF has an ST floppy controller it can handle up to 720k (originally the ST floppies could merely handle 720k too). Since the ST`s were upgraded with a 16Mhz Ajax chip to use 1440k, maybe one can also upgrade the XF with this chip and use HD. But it is a rather tough and expensive upgrade. why not live with 720k - thats enough for the little ataris. Or built the HDI interface from erhard Puetz, if you can... or use a Black Box and floppy board...

Like I've told some people, Windows is not bad. It's funny to hear people
talk about how bad Windows is, but yet an ST running CAB *CONSTANTLY* crashes,
but considering, it is cool.
Atari 400/800 computers have their moments, though it seems not many.

I guess the difference is, though the Windows machine is effective, I find
the Atari 400/800 computer has a soul (which I think equates to the chipset.)
I heard that same soul was in Amiga. I've starting to believe.

FamilyNet HQ: Telnet:\\www.family-bbs.net

I had this problem once. Back when I first started BBS'ing with my Atari
800. Now it works with the 850 interface and runs at 9600 baud. Yah!!

Here would be my check list...

1) Make sure all cables between the 850 and computer are in good working
order. I did this by checking each cable between the computer and disk drive.
2) I have my 850 at the end of the daisy chain (Computer to drive to 850
interface)
3) This goes without saying, but you'll need a special cable to run from
the 850 to the modem.
4) The R-Handler I found myself using was one coupled with Ice-T. Works
with Ice-T and Bobterm.
5) Test the 850 interface at start-up by listing to the wonderful sounds of
the disk booting up. It will pause for a second during startup as it looks for
the 850 interface. If you hear a raspberry sounds rather than two high tones,
it is not finding it for some reason.
6) I have the modem connected to port 1 on the 850 interface.
7) If you get the term up and running, hit "AT" a few times to get the
modem's attention. Then enter in "At&K0" which helps the interface in dealing
with some of the newer modems. (Think that had to do with error correction?)

Hopefully some of this helps.

Hello everyone, id like to announce a new project im starting, The ClassicMag project. The goal of this project is to preserve classic computing and gaming magazines for extinction. Most of us classic collectors love to have magazines for the systems we collect as, in the past the provided an immense resource for reviews, news, insights and programs. The goal of this project will be to preserve old out of print magazine issues in a PDF format. These will be scanned complete issues with advertisements let in, as they are as interesting and have just as much nostalgia value. Our web site is currently up at http://www.classicmag.net there's not a lot there as of yet but with everyone's help I hope to fill it soon. I've got a tremendous amount of space to be able to host these files. What I'm looking for is help from the community, if you have old issues, anything to do with computers or video gaming, please consider scanning them in getting them to us. If you can't put them in pdf form, no problem we can work out a way for you to get them images to us and we will get them in pdf form. I have a small list of magazines on the site now for some different systems, if you know of any I don't have listed please email with the details. I want this to be as complete as possible. I'm going to try and stay with mags published before 1995. I don't want to run into a lot of copyright issues. As always if a mag is on our site and the publisher, if there still around, wishes it not be there we will take it down, but hope they consider this project worthwhile and let us keep them there.
I believe this will be a great resource for everyone to be able to get a hold of some mags that are gone, but not forgotten. If you want to help with this project please email me at jim@classicmag.net . I look forward to hearing from people.

Thanks
Jim Oaks

IMO, this is not the way to go. Take the time to get permission FIRST.
It can be difficult to find the copyright holder and convince them to let
you put the material online, but it is worth the effort.

It is just safer to have the copyright holder's blessing before you start.
First, it means you won't get sued. Second, it means you'll save a ton
of work. What happens when you've just finished scanning the 100th
issue of PCjr Lover's Journal when you receive the cease and
desist letter from OmniMegaMediaPublishingCorporation, which now owns
the rights to that material? You'll have to remove the files
and will have wasted a whole lot of time and effort.

Sometimes, it is easier to get permission than forgiveness.

Also, I'll add that some publishers may not be able to even grant rights.
Many magazine contracts let the author retain copyright, in which case
you might have to track down hundreds of authors. I write magazine
articles for a living, and when I find someone has reproduced my work
without my permission, you can bet they'll hear from me. Even years
after the fact. It's still MY work.

One other thing -- less of a rant and more of a friendly suggestion.
Instead of trying to get every different magazine online at once, pick a
favorite, get permission, and work on getting every issue of that
publication online. That way you're not spread as thin. I've been heading
up the Digital Antic Project for four years, and we have just five issues
left to scan of the 88 that were published. I can see the light at
the end of the tunnel and it feels good.

If you do decide to focus on one magazine, you might want to use your
site (great domain name, by the way) to link to the other online magazine
projects like Antic, the Digital ANALOG Magazine archive, etc.

By the way, I have received permission to put Creative Computing magazine
online, although I have made to plans to do it myself... If you or
someone else wants to make that their project, let me know.

Hey, I agree totally, I hardly play any PC games anymore (except for Tetris) because they crash constantly. Windows may not be so bad (it is the most widely supported platform on the planet after all), but I'm buying a MAC, I am getting so sick of the crashes.

I also agree with waht Greg said, the Atari has a soul, it is an understanding and patient computer that will go through hell and back and still work (I think the 400 and 800 in my collection are living testemants of that, they still work and they are drinking age. How many other computers can you say that for? Most of the older computers I look at are blown to bits...). Oh, BTW Greg, how can you set up eMail, etc. on an 800? Find a BBS that has eMail? Let me know...

<soapbox, a Tide(r) one>

I would probably know a little more DOS if it was more common, I only know what little I do about DOS because I have the experience with the same commands in Sparta DOS. Perhaps someone should take some initiative to create manuals and such so that somebody can figure out how to actually use DOS!

And, I do agree that MS should wait around for a while before releasing a new version of Windows, fix the problems first before creating new ones. Besides, my computer is just getting used to WIN '98, give it a breather! Atari may be a little baby as compared to a modern computer, but at least the developers did not spend 60 or 40% of the time it should take to create a system for something that is "supposed" to be the whole 100%. As I see it, the developers understood the importance of making a program what it should be, not a bug infested quickie. Perhaps software companies should take some insight and see that it takes time to make a program and that certain deadlines are ridiculous!

I do have some formal training in art but I have never played Box World before so I cannot help you, if anyone has any idea about it I may be able to help. As for the music, I am not trained in that except for what I piddle around with on my 800, good luck there.

I was wondering about modems with the 8bit computer. I have a 300 baud 1030 right now and I am looking for an upgrade. I know that 14.4K is about as high as I can go without a black box.

Any suggestions as to terminal programs (I have BobTerm and 1030 express, sort of looking for TeleLink on cartridge for nostalgic purposes) and looking for BBS' and such? How about shell accounts for internet access (if not, I am waiting patiently for a Powerbook 170 that I got off of eBay with a 28.8K modem, I will not be crushed if I can't find a shell account)?

And for terminal programs.... where can I get manuals and/or instructions? I sort of played around with BobTerm but no real luck. Any input appreciated.

Jessica

Velcro-Spy is about the only person I've seen lately doing stuff with
A8 and modems. It is possible to do stuff with it, OH, Greg Goodwin
also does stuff.
But there isn't a internet program (browser, mail client) for the A8, so
you're stuck with shell account stuff, or a dial up BBS. There's a list
of BBSes mentioned in the A8 Welcome and FAQ.
You'll need an 850 or P:R: connection (or MIO or Black Box, but they
are expensive and rare) to go over 1200 baud. Or an APE cable
and APE software can interface your A8 to a modem also.
I think Velcro Spy found out that his modern modem just wouldn't
work properly with an A8.
You might go 9600 baud, but 4800 is probably better.
Bob Term is rock solid, but lacks the 80 columns of Ice-T.
The Bob Term manual comes with Bobterm12.arc, probably found
at umich or spudster ftp://ftp.spudster.com I think, in the telecomm
directory. Ice-T is probably there too. But if you don't have an
APE cable, how will you get it to your A8?
The APE cable is the best solution to a lot of A8 desires. It serves
as the easiest way to transfer things and is also a hard drive and modem
interface, all for about $10 if you make it yourself, not much more if
you buy one. Of course, you have to have a PC.

It's an excellent puzzle game. Want me to send the PC version to you ? It's only about 30-40K zipped (127 or something unzipped I think)

100 levels, totally mind crunching. Either let me know if you want me to email it to you, or do a search for Box World on Altavista. That's how I found it.

Take Atarian care

> Like I've told some people, Windows is not bad. It's funny to hear people
>talk about how bad Windows is, but yet an ST running CAB *CONSTANTLY* crashes,
>but considering, it is cool.

Yeah, but that's CAB crashing. The ST's OS is stable as hell. Even
NeoDesk, MultiTOS/MiNT and kin, run incredibly stable with little need
to reboot unless some errant program decides to play silly buggers.
Windows, on the other hand -- be it 95, 98 or the new ME, will crash
on a whim -- though to be fair WinME is more stable than its
predecessors (at a tradeoff of real mode DOS and numerous, though
largely unimportant incompatibilities. The most significant of these
being Norton AntiVirus and McAfee AntiVirus, both of which use
DOS-based programs at boot time that WinME will bluescreen on.
Although annoying, there's always the free InoculateIT, which runs
just fine, has a comparable virus database, and is updated at least as
frequently. There are also a few firewalls that die -- but again, the
freeware ZoneAlarm works wonderfully)

> Atari 400/800 computers have their moments, though it seems not many.

> I guess the difference is, though the Windows machine is effective, I find
>the Atari 400/800 computer has a soul (which I think equates to the chipset.)
>I heard that same soul was in Amiga. I've starting to believe.

The soul is called quality. Everything about the PC, from the OS
itself, to its applications and games, is about money -- faster
turnarounds on titles with higher budgets and lower quality control.
Games in particular suffer from shorter deadlines, higher budgets to
add lots of spit shine and polish to feed the eyes and ears, but lots
of bugs (requiring an equal number of aftermarket patches), less
playability and, the thing that made 8-bit game so fun to play, less
RE-playability. Part of that I think is the fact that games these
days rely more on realism and immersiveness, whereas games on the
8-bit, being far less realistic graphially and sonically, tended to be
more abstract, especially with gameplay. That abstraction is a large
part of what made games so great and addictive. Then there's the
everything-and-the-kitchen-sink factor in games like the Alternate
Reality series which, while still being graphically and sonically
inferior to today's games, had within them so many elements that led

to incredible immersiveness and addictive gameplay due to the sheer number of "little things" and afterthoughts that were added to the game to make it just that much more enjoyable -- more bang for the buck, if you will. These days, the only bang for your buck is the sound of your wad of cash hitting the counter. Back in the old days, games were made by a small few -- much of the time just one person. And that person had the leisure to make his game right the first time. It was his or her (or their) project alone, and they were given virtually carte blanche to create a vision, then turn it into a game. Nowadays games are all formula, relying both on proven, best-selling game genres with pre-built game engines licensed from their creators. Canned code, canned ideas. Sort of like the spam of the video game industry. There are few true innovators left ... just people improving on their predecessors.

If you can find it, try grabbing UnPack Pro 2.2b. It handles ACE and
RAR, and integrates completely into the Windows context menu. Once
installed and configured, all you need to do is right-click on any
ACE, or RAR/001 file and select your extract method... nothing easier.

Well, I for one think this is a great idea -- but getting permission
might be difficult.

Antic (and ST spinoff STart) already has their own website up for
their magazine issues, for example (www.atarimagazines.com) and
feature full issue content (articles only) and type-in programs ready
for download. There is also a fledgeling A.N.A.L.O.G. archive in the
works, too, though it has few issues, most of which are incomplete and

many are poorly scanned.

If you can manage to pull this off however I think it'd be great! I'd particularily love to see all the classic Compute! issues.

Hey... while we're on the subject, are there any Atari pages out there that feature scanned/OCRed books on Atari? I bought quite a few way back, from the utterly-essential Mapping the Atari, to other programming books on graphics, gaming, etc. That'd be quite cool to see again.

Thanks for the offer. Emulator maybe ? Or even bitmapped PC ? I could code the graphics data in myself, if I only knew how the legs and arms would move. You know the animation process isn't my strongpoint. It's pretty hard to get a 8*8 character to look really good, but that's what I need.

Thanks again! I appreciate the answers I got.

The ST OS is tough as old boots isn't it? The thing is though, the 8bits had a 10K OS with a fixed set of hardware. The ST had 192K of OS and fixed hardware. The poor old PC/Windows has 100Mb of OS, countless layers of OS services/addons/features as well as a need to support thousands of different bits of hardware in any combination. The fact that it runs at all is pretty impressive IMHO. Look at the trouble Linux has had supporting newer PC features and any esoteric (i.e. not REALLY common) hardware. NT was only stable due to the restricted list of supported hardware although the change to the video subsystem between v3.51 and 4 destabalised it to an extent.

Windows is bloated as hell but it's still moderetely impressive stability wise.

We agree, Ian.

Mac OS also has to contend with a very limited hardware base. People complain about crashes in Windows because they have to use it more often than any other OS. If ME improves some things, crash-wise, I'm for it. I will mourn the loss of Real DOS, however. There are things you can do in DOS that just can't be done in Windows.

Like 2 paddles, the pad has a X and a Y resistance. Touch it and the
resistance changes, producing a change in the X/Y values.

>> I've never been able to get a 1.44 to work as a 1.44 with my ATR8000. I have heard of people that use a 1.2 meg 5.25" and just format it using the 8" DSDD parameters to get ~1 meg. <<

Ditto. 1.44 and 1.2 drives both use a 500Kb/sec HD data rate. A 1.2 might look to the ATR 8000 like an 8" monster, which I believe had 76 tracks and 15 sectors/cylinder. (? - IIRC.) A further complication for the 1.2 is that they always spin at 360 RPM. At the same data rate, that means more space is taken up for each sector. 360 rpm, is 20% faster than a 300 rpm DD drive. 18 sectors/track is also 20% more than 15 -- it might fit. But if someone knows how to get the ATR to do 500 Kb/sec, please share this.

<rant>

Granted, Windows' instability is due in large part to its wide-open architecture and piecemeal design -- the more bits that make up something, the more things can go wrong with it. Nevertheless the problem is mainly that Microsoft has had a running track record of releasing a few token bug fixes, then just releasing a whole new version of the OS, presumably to keep the water from going stale and word of mouth about the existing version from polluting the digital genepool. They never bother to fix the problems that exist before going ahead and adding all sorts of new things that just end up spawning whole new breeds of bugs. (Of course, if they did that we'd still be using Windows 3.1...) Look at the fiasco that was Windows 2000; a list of bugs, leftover rubbish, incomplete code and other 'issues' longer than Tolstoy novel -- 65,000 in all. And they released it to the consuming public that way. My whole beef is that they should at least clean up their act and finish what they start before releasing something. Far too many companies have adopted this practise, and the end user ends up paying the price. If I had a penny for every time a blatant Windows bug has crashed my computer, I'd buy Norway. Besides, the bulk of NT's stability is the fact that it was not built upon the DOS kernel; it was re-written from the ground up, only emulating DOS from the Windows shell. Unix, despite its lack of support of more esoteric hardware, is also probably one of the most stable, current generation OSs out there (well, your mileage and

distribution may vary).

DOS is still there -- the only thing missing is "real mode" (16-bit)
DOS, meaning any applications that require "real mode" (very few, and
only old apps) won't work. Any other apps or games that use a 32-Bit
DPMI run just fine. (Once again, your mileage may vary; I've found
some games, such as Duke Nukem 3D, Shadow Warrior, etc. frequently
experience granularity errors and crash. Others run just fine)

Don't hold your breath. It's been a practise for years... some
companies release a program riddled with bugs so they can make money
selling it in order to finance the development and bug fixing of the
rest of the game. Other companies just don't really do that much of
their own beta testing; they let the public play the game and report
the problems after the fact. Me, I consider all software released on
the PC these days as a "wide beta" until they fix all the bugs.

In spite of my beefs with Windows, I still won't buy a Mac. I just
don't like 'em. Besides, I am NOT trading my nice five button optical
mouse for a dinky little one-button opto-mechanical. That's just
barbaric. :-)

>I also agree with waht Greg said, the Atari has a soul, it is an understanding and

>older computers I look at are blown to bits...).

The "They don't make 'em like they used to" factor. And they don't!
Since I bought this PC in the late fall of 1998, I've had to replace
two hard drives (died completely -- one two days after I brought it
home!), one monitor (flyback transformer went "squish"), two keyboards
(er ... my fault; they don't drink Coke. I did that with two ST
keyboards, too...), two mice (They stopped tracking properly), one
motherboard (Static cling; I should've used Bounce), and my BIOS
battery *twice*. And my system clock STILL loses time! (Does your
R:Time-8? I didn't think so.)

"Where do you want to go today? How about the recycle bin? It's nice
this time of ye---<poof>"

Yep. The 8-bits were tanks. I did go through a few minor problems;
one keyboard lost a shift key, one of my 1050s snapped a drive belt,
and those damned power supplies -- no less than four of them burned
out on me. But none of that rivals the money I've sunk into this PC.
I paid $2,000 for it initially, and I've sunk at least that much again
into it, both on upgrades and replacing dead parts.

For that kind of money I could go out and buy every Atari model ever
made, with every peripheral, and still have money left over for a new
TV. :-)

Obviously, you don't understand the vernacular of the 8-bit. To make
animated sprites on the 8-bit, you have to programme display processor
interupts line by line to execute the animations you previously spoke of.
Also, assembler compiles down to machine code, and rarely has anyone
programmed any significant amoung of code directly into machine
themselves. It is almost always done in assembler, with a few programmes
done is something slightly more sophisticated, like BASM (Basic /
Assembler, a psuedo basic with assembler code directly incoroporated also,
that compiles down to machine code directly). You need to talk with this
guy. He can definately help you.

Who are you talking to now ? I am not understanding what you mean ? If it's me you're speaking to, I've done several demos in assembler and done some animating, but I am not that good at it. And I do understand most of the Atari 8-bit, I do all my stuff with AMAC and Textpro as well as a nice tool called Codebuster. That's mainly what I use. Also used font editors from time to time, but usually draw them on paper and code it directly into my program. And if it's the other guy, how can he help me if he can't draw the graphics, which is what I need. I might be confused about who you are addressing though.

Take Atarian care

I looking for these two games:
1. Star Trek by Adventure International
2. Star Warrior by Automated Simulations

I have found two other games by Automated Simulations I was looking for (Crush, Crumble & Chomp and Rescue At Rigel), but SW was no where to be found. I also came across Galactic Empire by AI which was a good game.
TIA, Patrick

If Microsoft waited until ME, or any other software was perfect, it would take an eternity. How can you wait to see if it will work with every hardware and software configuration, when several new ones of each are released by other companies every day?

Even if that were not the case, Microsoft would probably have to test each new edition of an OS for much to long to make the process economically feasible.

One thing you have to remember is the distinction between "direct connect"
modems like the 1030 and those requiring an interface (850 or P: R:, for
example.) The only modem that could ever be used at 1200 baud as a direct
connect for Atari 8-bits was the SX212.

One VERY important detail on using faster modems is this:

They require a cable from the interface to the modem that LOOKS very much
like a cable that's sold for PCs (9-pin connector at one end and 25-pin
connector at the other.) The gender of the 9-pin is wrong, and some people
think that can be cured with a gender-changer. In reality, though, the
internal wiring of the cable is incorrect for use with a P: R: or an 850.
You need a special Atari 8-bit modem cable, which is probably only available
from Best Electronics or B&C Computervisions at this point.

Ken, that's a great resource.

Only one problem:

Although the shells listed have URLS, none of the shells the page lists have
dial-up numbers, which the average 8-bit Atarian would need to connect.

That won't work for her. The HELP command required DOS Basic which is
sadly missing (without any replacement) in Windows 98.

Under Win 98, type <command> /?

eg. DIR /?

It's a blast from the past. The .XMO extender was from back in the early days where there were text and binary transfers. The .XMO was just meant to indicate something outside of a normal ASCII character set so do a binary transfer via xmodem.

> A game in Antic Magazine from around 1990? called Biker Dave.

It's at http://www.atarimagazines.com/v8n5/BikerDave.html --
it was the September 1989 issue.

Biker Dave trivia: the program was published in Antic under the byline of
Erik Lowell. But it was actually was written by David Schwener
and first published in the November 1986 issue of COMPUTE! magazine.

In a letter in a later issue, another reader wrote:
"Perhaps Erik Lowell figured no one would remember or know where the
program was originally published, since three years have elapsed since
publication. Your article said that Lowell is a 14-year-old from
Massachusetts 'who is very interested in becoming a professional software
developer.' It saddens me to think that a young person would choose to
obtain his first professional programming credit in such a callous way.
I imagine his career will be very short if this trend continues."

I wonder what happened to Erik Lowell.

If you check the W98 CD, you'll find "\tools\oldmsdos". It contains the full DOS help facility plus the required Qbasic. Copy the following into C:\Windows\Command:

Help.com
Help.hlp
Qbasic.exe

Total disk space required is 485 KB. If you figure you might want to use Qbasic for other purposes, you might also want to add Qbasic.hlp (another 127 KB).

Hi all,

I need some help please.

Would anyone knowing a dude who uses an email address containing
the words "Edward Scissorhands" please let him know i'd like him to contact me
Re. the hardware deal. He is a UK resident.

I really appreciate any help, as would he.

1. I downloaded SIO2PC and the file will not open, I keep getting the "Identify File Type" prompt. Since I have NO FRIGGIN IDEA how to use DOS, that doesn't help much, does it, let alone the fact that the file will not open.

2. It took me forever in a day to find SIO2PC on the 'net. Any idea about getting an executeable version of it?

3. Many of you are being extremely vague when answering my posts. Though I know that everyone is trying to help, it is still extremely vague! You have to remember, I still do not know anything about hacks into my system or downloading files onto the 8bit.

4. As for the cable, is there a USB version of the cable or am I stuck with the 9pin serial cable? I only have one 9pin hole open on my PC and I need that for my digicam. A converter perhaps?

Probably means you downloaded one that is not a self extracting archive.
Sure sign will be if it has an extender of .ZIP on it.

Try finding either PKZIP or WinZIP and figuring them out. Either one should
be able to take care of the balky file.

Larry did a poll on what people are using. From the results of his poll, I
got the impression that people just got something that worked and stopped
looking for upgrades. Very few APE 98 users, I for example have SIO2PC on a
Tandy 1000 TX 8 mHz 286 with 640k of memory and a 30 meg hard drive. It
isn't that APE isn't greatest thing since sliced bread or a Windows thing,
it is just that I have the Tandy and if it ain't broke, don't fix it.

I am a real slug on some of this stuff, probably haven't used SIO2PC but 2-3
times in the last 5 years. I would need a refresher to get up to speed.

You should be able to buy one of those 25 pin to 9 pin serial 'dongles'.
Just make sure you have the female/male plugs right. $3 bucks tops if you
didn't get one with a serial mouse or some other serial device.

If your current mouse is serial such that you don't have a spare serial
port, I would go with the Microsoft USB optical mouse, they are really nice.

I dug an atari 800 and a Voicebox speech synth out of a barn, and lucky the atari still works... Now, I'm trying to figure out if there's a way to make it talk via BASIC. If so, could someone please send me some sample code.

THANKS!

Andreas Magenheimer (magea000@mail.uni-mainz.de) wrote:

: Well,
: ABBUC Floppydoc (Erhard Puetz) once built the HDI (High-Density floppy
: interface), that could attach 1-4 Floppy drives to an Atari SIO port.
: The floppies could be 5,25" 80Tracks DD (720kbytes, PC or something) or
: 3,5" DD/HD 80 tracks (720k or 1440k, PC, Amiga, ST, etc.) The interface
: was sold out very soon, but you can still find the schematics on his
: homepage. Just visit ABBUC:
: http://www.atari-computer.de/abbuc
: and click on the button "Floppy Alchemie" which will link to Erhards
: Homepage (sorry, I do not know the direct URL). Once there try to find
: the schematics for the HDI - maybe you can built one yourself... By the
: way, the HDI supported single, double and high density (40 or 80 Tracks,
: dd or hd, single or double-sided) but no medium/dual density (1050
: format). Therefore it supported ultra speed known from happy and speedy
: drives...

: greetings - Andreas magenheimer

: P.S.: There is of course also the Black Box and its Floppy board, that
: supports 3,5" floppies and with an XF floppy you could at least reach
: 720k with a 3,5" drive and a slightly changed OS...

Erhard came to visit me recently. He discussed this HDI which I thought would be REALLY cool to use with my Atari 400. Although he does have ONE PCB left, he was unable to build me one as they no longer make one of the chips it uses, and he cannot find any more.

Anyhow, Erhard is a great guy, and very bright. It was an honour to have him as a guest.

My friends and family really like him.

Save the link to Nick's home page if you're going to use SIO2PC. That's
where you'll find the latest versions and info.

> 3. Many of you are being extremely vague when answering my posts. Though I

You don't need any 8-bit files to get SIO2PC up and running. Once you do
so, you might want to transfer file2pc.com/obj to the Atari via the
cable.

>
> 4. As for the cable, is there a USB version of the cable or am I stuck with

It's serial only unless you wanted to spend a lot of money on some sort of
USB to serial interface. Assuming you're not going to try using both at
the same time, you should be able to get away with a splitter-type cable
or an old modem switch box though the latter might need a DB9-DB25
converter.

Let me know if you need more info.

jkp

First go here for the latest version of SIO2PC and FAQ

Sio2pc Home
Page

Then get this file:

pk250dos.exe

Since you're unfamiliar with DOS, simply run pk250dos. It will produce several files. The simplest way is to run the following command line:

zip2exe sio419.zip

This will convert the .zip file to a self-extractor named "sio419.exe"

Change to the directory where you want the SIO2PC files and run the new .exe produced above.

Yeah. I built a few of those for assorted individuals who then went on to PCs and gave the cables away with their Ataris.

I also built one for myself and... you guessed it ... gave it away, too.

I guess you have a zipped SIO2PC.
I would also guess that SIO2PC is going to be less 'intuitive' than
APE '98.
As for the serial port, you only have one, it shouldn't hurt anything to
unplug your digicam and plug in the cable. You can't use them both
at once anyway. If your modem is internal, you can still use APE
for a modem interface.
Good Luck.

The problem is that my unzipping utility does not recognize it as a .zip file. Anyway, jkp is getting me straightened out. You are right about the intuition, Atari I know, Windoze I know, Linux I know, DOS I do not know. Guess it is high time I introduce myself to good ol' dos. Thanks for the luck wishes.

All you need to do is to all the way to the bottom, left to the next
set of platforms/balloons/etc., then finish that area. Then you'll be
brought to the next stage of the game ... not really a 'secret' area,
IMHO, just that the 8-bit Atari version is larger than the 2600
version for obvious reasons. (I didn't know the XEGS version was
different though)

I've used trumpet valve oil on my 1050, you just have to be
careful not to let it run where you don't want it. Works best to
use a Qtip to apply it.

I am not saying to wait until every bug is cleaned out, it is a given that there will be bugs, but just wait a little longer than three years to relase a new OS version, or longer than a few months to develop a software program/game.

Uh... no it doesn't, and isn't. It requires the IFSHELP.SYS in your
config.sys, which is still present with Win98. Now, under WinME you
won't have any luck... real-mode DOS is missing and therefore, so are
your config and autoexec files. (Well, they're sort of there; they're
imported into the registry)

>feasible.

It's not even that MS should test with every conceivable
hardware/software combination; no matter what there are going to be
problems there. It's simply the bugs that are endemic to Windows 9x
itself, regardless of your hardware configuration.

For you 98 users, try this: Open a context-menu (right-click) on the
desktop. With the context menu still open, double-click on any icon
from your desktop to open/load it. (This will also work if you have
an A4Tech 4D+ WheelMouse and have the thumb button configured to
activate CONTROL; hit the button with a context menu open) The
context menu will now stay open ... forever (or until you reboot) and
will remain on top of anything you load. This is an Explorer bug,
inherent to Windows, and as far as I know will work regardless of
systme configuration (though it *may* be related to what explorer
shell integrations you have installed).

It's just things like that I wish they'd fix before galavanting off
and making a new version. Or even releasing that one.

Todd (javen367@aol.com) wrote:

> How do I get to the secret area in Pitfall 2?

I'm guessing that you're referring to one of two things:

At the very beginning of the game, when you first go underground, there is a room you can't get through because of a rat; it keeps pushing you back to the right (where you entered from), and you *cannot* jump over it. That room leads to the place where you'll end up when you finish the game, so don't bother trying to get past the rat; you can't. I guess this was an insidious trick by David Crane to drive players crazy! :-)

Much further along in the game, there is a room you can see, with a diamond ring in it. You must collect the ring to get a perfect score, but there is no really obvious way into this room. The way to get into the room is to take a "leap of faith," if you get my drift. In other words, you can jump off of a ledge, and you'll (hopefully) land on the ledge that's outside of that room. If you jump off of the wrong ledge, you won't be able to reach the room; instead, you'll land (if you're lucky) on a ledge that doesn't go anywhere. And if you jump off of *that* ledge, you'll bounce off the walls, fall, and lose points. The only way to collect the diamond ring is to jump off of the correct ledge, land safely on the ledge outside of the hidden room, jump off of *that* ledge, and land safely on another ledge (from which you can then go to a ladder and climb down).

By the way, I'm assuming you're referring to "Lost Caverns" for the Atari 2600, *not* one of the other "Pitfall!" games for another game system.

I did screen captures of every room in "Lost Caverns," and assembled them into a map of the game. If you want, I can e-mail it to you.

You left out the water in Pitfall!

That problem occurs because of the way Atari800Win maps the Atari's colors to the PC's colors. The mapping is, shall we say, less than perfect. This is especially obvious to anyone who has programmed for the Atari 800, and is familiar with what the various hues and luminances are *supposed* to look like (although the displayed colors could vary a good deal depending on your TV's settings).

There is at least one version of Atari800Win on the web-- I don't recall the URL offhand, but it's a European page-- which lets you load your own palette file for the emulator. The only trick is, if you want to create your own (improved) palette, you must first determine the appropriate values to use for each of the Atari's 256 colors. I have screen captures of the Atari's 256 colors, and I once started to create my own palette file, but it was a lot of work, and I never finished. You have to load the screen captures into a PC paint program and see what RGB values the Atari's colors correspond to. Unfortunately, a "solid" color on a screen capture (from Atari to PC) isn't really a "solid" color, because it's made up of a lot of pixels that differ slightly from each other. That means you have to pick the color that's more or less the average of all those pixels, and it isn't easy-- at least, not with the paint programs I have. And once you figure out the best RGB values to use, you have to enter them into the palette file (I found the old MS-DOS "DEBUG" program to be ideal for this). It takes a lot of time and patience to do a good job, which is why I haven't finish doing it (yet).

By the way, the same version of Atari800Win which lets you load an alternate palette file *also* lets you adjust the display settings to match your monitor's scan rate, thus allowing you to do page-flipping without the ugly flickering that results when the settings are off. This is really an "unofficial" version of the Atari800Win, modified by someone in Europe. On the other hand, those particular enhancements may be in the latest "official" version; I haven't checked it out yet.

There are tons of DOS manuals from a variety of suppliers. A quick search on Amazon will turn loads up. Having used DOS PCs for many years prior to Windows I'm more than happy poking around the system at the DOS prompt. It's not so bad once you've spent a few hours playing around. Later versions of DOS had built in help so you can generally add /? to a command or type help xxx to get info.

>Perhaps software companies should take some insight and see that it
>takes time to make a program and that certain deadlines are ridiculous!
Alas modern software gets so cokplex it really is getting impossible to debug 100% as it is simply beyond our brains and current levels of support tools. It's one thing to understand all the inter-relationships in 10,000 lines of code, another to be able to grasp and follow 10 million.

As for the copyright it will still be a violation of law. The
publishers may not care but I wouldn't count on it.

> As always if a mag is on our site and
> the publisher, if there still around, wishes it not be there we will
> take it down, but hope they consider this project worthwhile and let
> us keep them there.

You should really try to get the permissions first. I (or rather the
admin of atari-computer.de) got permissions from three publishers
(sorry, only German ones) who were all quite cooperative. It's not that
hard although some mags gave the rights for their articles back to the
authors (like the German mag "Data Welt"). In this case you would have
to contact each author and get their permission.

> I believe this will be a great resource for everyone to be able to get
> a hold of some mags that are gone, but not forgotten.

Sure - although I don't like the PDF format but that's my personal
opinion :-)

Greetings,
Matthias.

No, no...I mean the secret area that is only in the Atari 400/800/XL/XE and
5200 versions of Pitfall 2. I completed the Atari 2600 version way back in
84'. I recently picked up Pitfall 2 for my XEGS and wanted to get to the
secret levels of the game that are only on the Atari 8-bit version that I heard
about oh so many years ago. Sorry, I should have been more specific.

Well, you can get there, of course, and you can even collect the rat - from
the back, so to say. But you've to finish the first level completely, this
is the last room you get in.

After that, the game will continue with the second level with a maze which is
as big as the first one, but more complicated to play. Maybe there's one
so to say, "hidden" area which is again on "ground level" instead of under
the earth. To get there, you need to collect all the items in this maze. The
game ends there (in a not so impressive way, but anyhow...).

So long,
Thomas

5045. Chat at #atari8 this Tuesday Night!

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-14 00:00:00 UTC
From: NOSvelcro@netunlimited.netPAM
Message-ID: <3997f2dd.507982@news.netunlimited.net>
Source record: 42794

This announces an IRC chat for Atari 8bit enthusiasts. It
is scheduled for August 15th, 2000, 10:30 pm Eastern US
time. Here are the corresponding times for some other
places, choose the one near you.

California: 7:30 pm. Colorado 8:30 pm. Texas 9:30 pm.
London, England: 4:30 AM. Berlin: 5:30 AM. Hong Kong:
11:30 AM.

The topic for the chat will be "Disk to Disk-Image & Back" and will
focus on working with the ATR and XFD files available widely on the
Internet.

General Atari8 chat is also welcome. If 7 people show up, I
will provide a doorprize. The doorprize is a like new copy of Preppy
II by Russ Wetmore. There may also be the giveaway of a full color map
for Alternate Reality the City, if we get 10 people.

This will be a standard IRC chat. It is not a web-based
chat on your browser. You need an IRC client, such as
mIRC. The chat will be on Amiganet. Here are some
servers that will get you there:

irc.whiterose.net
thule.no.amiganet.org
linux.us.amiganet.org
au, uk, se, no & us.amiganet.org

Once you log onto a server type "/join #atari8" and we
will be there waiting for you I hope!

Yep, I have the disk which came with my first drive. I am guessing it is the REGULAR AtariWriter, since it is pretty primitive and can recognize four drives. Probably just, as I said, the programmers forgot to think of that (pretty dumb move...).

On a similar theme, I have been looking for what I think was Balance
of Power (by SSI) There seems to be no mention anywhere of it. It was
an old start ship to start ship combat wargame, based very much on
Starfleet Battles. I used to have it many years ago before my machine
died a death.

That is very a misinformed interpretation of copyright law. There
are certain provisions for using portions copyrighted material for what
is called "fair use," -- but fair use does not allow you to reproduce
entire magazines filled with copyrighted material. Even for
"educational" purposes.

Ok gang, I have an Atari Lynx for trade. I have two of these wonderful little machines, but have only one set of hands. So, I have decided to offer one up for trade. I am interested in an NEC TurboDuo in good condition. Or, if no one has one of those for trade, I would be interested in an Atari 7800. If interested, e-mail me direct please.

The Lynx is in great condition and still in the box. In light of the condition of the Lynx, I am only interested in systems in like condition. I do not want anyones junk please. The Lynx comes with the following games:

No box or manual unless noted.
Lynx still in box. Box is like new also.
Xybots
Bill & Ted (w/instructions)
Hydra (w/manual)
Batman Returns
Crystal Mines II (w/manual)
Steel Talons

Or (same site) try 'INSERAT'

And click on the E-Mail address too, you get four 'regular' issues and two
'special' ('Sondermagazin' in German) issues of the disk based ABBUC Magazin
for DM60 per year. Since your message was in German, the fact that the magazin
is in German will probably be no problem to you.

CU Mathy van Nisselroy

BTW on Oktober 28th, 2000, the yearly meeting is held at the Buergerhaus Sued
in Herten, Germany.

Hi Jessica,

Sorry, but its been a while since I took a look at APE 98, but I'll try to help from memory...

APE 98 is probably the best program out there if you're confused about what's going on in the program. Its easier to use than the DOS version, especially if you are unfamiliar with DOS and command line operating systems in general.

You want to go into the APE 98 settings (double click on the little Atari icon on the task bar, and choose Settings from the menu) and make sure you have the correct COM port selected in the settings dialog box. If you have a modem, this could be on COM2 and the remaining serial port in the back of your box could be COM1. This is just a guess. You need to check how your machine is configured.

Next you need to pick the right cable type. Is your cable a single-chip version or not? If you are not sure, try both settings in APE and see if you can get it working. I'll bet its a single chip version... they are the easiest to build, and seem to be used most widely.

Finally, you have to "Mount" a disk image (a *.ATR file) in the drive1 slot in APE. Then you should disconnect your real Atari drives. This is not a requirement, but for troubleshooting its best to be simple at first.

A little experimenting with the COM port settings should get you a successful boot.

You know, I used to believe that 850 interfaces maxed out at 4800 baud back
when I used Express850. However, with Bobterm and Ice-T, 9600 baud is not a
problem.

Great advice. One other alternative is to get with Rick D of "More Than
Games" who hangs out there and on the Online Atari chat on Thursday nights.

He sells a variety of adaptors that will allow standard serial cables to be
used between the 850 interface and modem.

And he has other adaptors. Pretty cool!

There's another thing you can try to corner the problem.

Try using a RPM testing program and see what happens. If the drive spins but
you don't get an RPM reading, then all the electronics are probably good
right up to the controller and head circuitry.

Eric,
Emmanuel has a great product. I have had one for a few years now,
and there's nothing like plugging a couple of wico joysticks into your
pc. I love it.

llpwhite wrote:>> I've never been able to get a 1.44 to work as a
1.44 with my ATR8000. I have
heard of people that use a 1.2 meg 5.25" and just format it using
the 8" DSDD
parameters to get ~1 meg. <<

This is what I do. I decided to not have to search through two
disk formats for my A8. I'll stick with 5.25. Someday, I'll
hack Mydos to modify disk formats to give more control and get a
full 1.2 meg from the disk, but I have several hundred here, so
I'm not in a hurry.

I don't think the ATR8x00 and its controller can use a 1.44 3.5
inch drive, and the sense line is not present(major hack).
Easier to hack a XF551.

I have plenty of 64K portfolio memory cards, though the battery
may need replacing.

$25.00 each, or 3 for $50.00, U.S. funds, reg shipping included
to US or Canada, $5.00 for priority.

>Greg Goodwin" Greg.Goodwinp0.f2.n8.z8@fmlynet.org remarks:

>But AtariWriter can access drives where AtariWriter Plus cannot. ???

The A+ manual does not explain why; on page 19 it merely says ".. can load from drives 1 and 2 only." The 'only' is in italics.
I will dig out that old AC; if you can access D9: then D3: thru D8: are certainly possible!

-Ron

I don't have a solution but I admire the problem.

>"Greg Goodwin" Greg.Goodwinp0.f2.n8.z8@fmlynet.org asks:

>Ron,
> Was it you that mentioned your MPP 1100 interface had gone out?

'Twas I; blew it during a hot swap a few years back. As soon as I heard the little 'click', I sure was wishing I had cycled the power in a little bit less of a hurry. I still have a working CardCo and ApeFace but the MPP had the chainable SIO port.

I am a little sparse on fodder for very much 8-bit barter; most of what I no longer use is dead. What are you seeking?

-Ron

I don't have a solution but I admire the problem.

I am guessing they just forgot about it, I know it happens when you are programming. Try the patch, it may well work a little better. BTW, I have a copy of AtariWriter that is a disk, but I have no such problem, it is just like the cartridge, are you referring to a different issuing of AtariWriter?

Here is what I want and what I will pay. Thanks! -Satcom2

Mountain King $10
Super Zaxxon $40
Choplifter (XE version) $10

I have a copy of Hypnotic Lands w/manual (leaflet) for the Atari 800xl, made in Italy (I believe), very rare game from early 90's (1993 I think) kind of plays like Klax and is EXTREMELY rare and fun also! I would trade for Super Zaxxon and I think that is a fair trade. I also have Airball and Fantastic Voyage carts I would trade for the other 2 easier ones. Thanks for looking, and check my Ebay ads this week at:

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=satcom2&include=0&since=-1&sort=2&rows=25 -Satcom2

Fair use allows many things as long as the intent is not profiteering.
While archiving the latest issue of Time would not be covered, a 10 year
old magazine can easily bo copied and archived for educational purposes,
providing there is no profiteering and the entire work is no available
as a complete download for personal use.

I am not a lawyer, but I do run a business and have to knwo at tleast a
little bit about these things.

5084. Message for UK owners (Maybe US)

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-16 00:00:00 UTC
From: Paul Irvine <mclane@btinternet.com>
Message-ID: <kiskpsoes96047o92oe4fr3rr2rlr6ibo1@4ax.com>
Source record: 42654

One of the few UK shops left with some Atari 8bit stuff is Computer Cavern in Marlow, Bucks.

Just had a wander in yesterday while taking my wife and baby to see where I used to live before I moved to London. Had a long chat with the owner and he has a list of games (not complete, as in some are not on it and some that are may no longer be avail) that he can email on

capri@globalnet.co.uk

Or call the shop on 01628 891101 if interested.

The software list I have from him is mostly tape based but has some good UK titles like Kenny Dalglish soccer & Steve Davis snooker which might not have made it to US peeps who collect.

He has 'some' hardware left but we are talking a machine, a printer and a few PSU's but you might want to ask.

He also has a good range of ST and Amiga stuff and maybe an odd trinket for other systems.

Anyway, have fun...Thought I would pass the info on for the starved UK front who might not like to mail order bits from the excellent US folk or for the US folk who might want to chat to the guy incase he is willing to mail bits to the US.

Btw, he might be willing to sell as a lump to someone...

From: krieg@earth.execpc.com
Message-ID: <399a9be2$0$72395$726baab@news.execpc.com>
Source record: 42656

OK, here's my list of favorite 8-bit games. By coincidence, this is also my 'stranded for all time on a desert island with only these games to play for all eternity' list as well!

Arcade Translations - The 8-bits got their share, and most are great adaptions. These are some of best, guaranteed to give your wrist a work out.

Arkanoid Centipede Defender Dig Dug Donkey Kong
Food Fight Frogger Gorf Joust Mario Bros.
Missile Command Moon Patrol Mr. Do Ms. Pac-Man Pooyan
Popeye Robotron: 2084 Super Pac-Man Tapper Wizard of Wor

Maze-like Games - Derived from the original Pac-Man maze craze, these games took it into entirely new concepts.

Boulderdash - This family of titles is great, but the original is still my favorite.
Crossfire - This game is awesome. The premise is so simple, but the game is so addicting! Why was this idea never ported (or stolen) for the 2600? It would have been a winner.
K-Razy Antiks - Another of my all-time favorites. You can really get into the zone and play this one for hours.
Lode Runner - Pac-Man with ladders. Classic.

Platformers - Long before Nintendo made this format their own, the 8-bits produced some classics.

H.E.R.O. - Activision's classic looks and sounds great on the 8-bit.
Jumpman
Jumpman Junior - I prefer the original to the more common Junior, but both have their highlights.
Miner 2049er - 10 classic platforming levels.
Montezuma's Revenge - A litle repetitive but one of the first games I completed.
Pharoah's Curse - How can you not like a game that used Bob & Doug McKenzie references for passwords!
Pitfall II - Another Activision great, with the bonus level to boot!
Spelunker - Verrrry tough platformer, but fun as heck.

Exploration - You never know what will happen next as you explore these games.

Castle Wolfenstein - Long before ID, this game rocked.
Gemstone Warrior - Anyone solve this one? I've gotten soooo close...
Journey to the Planets - Put on your thinking cap.

Seven Cities of Gold - Wonderful way to spend a couple of hours.
Shamus - Another favorite I actually solved.
Shamus II - Ditto.
Spin Dizzy - Move over Marble Madness, this game kicks your ass.

And the Rest....

Archon - Chess was never this fun...
Blue Max - I hate flight sim games, but love the bombing runs
in this game.
Bruce Lee - Gronk!
Drelbs - One of the most bizarre games ever. I love it!
Leader Board - Nice golf sim.
Mountain King - Creepy and fun.
Necromancer - See Drelbs!
Trolls and Tribulations - Frustrating as hell, but I keep trying to solve it.
Whistler's Brother - Give a little whistle....
Zybex - Great game! Should have been an arcade title!

If your 8-bit collection is feeling tired, look up some of these titles to pep
it up!

Oh yeh! You've seen how smoking will yellow teeth.. and teeth when you get right down to it are amazingly resiliant.

At work it used to be a smoking building, now non-smoking (which is a good thing, since buildings don't need to smoke.) :) We moved some cabinets that hadn't been moved in years and you could see the walls that were once white that turned a mustard yellow.
Naturally the wall around the cabinet had been repainted when the discoloration happened... just not the wall behind the cabinet.

Really fascinating. And of course, I'm amazed by how much abuse the human body can take.

Reminds me of segment of a Bugs Bunny cartoon where they had a spoof of a
Groucho Marx show "Bet Your Life" where they had "Beat Your Wife". Bug's posed
the question to Elmer Fudd "So, when did you stop beating your wife?"
(How do you answer a question like that? He was obviously stumped...)

Anyway, you don't see that cartoon much anymore, nor do you see the Peter
Loree spoof (as a fish) saying "Now I've seen everything" just before shooting
himself in the head, and all the countless times explosions happened, bringing
on the black spoof, and the old chinese hat gag....

Ah well... we always have comedy central for Southpark and other
politically incorrect cartoons I guess. ;)

As for using a manual... why didn't I think of that? Of course, I have
some devices that are smaller than the manual, so I would probably destroy them
if hit by their own manual. ;)

Yep, this was intentionally left out as it is somewhat redundant. You can achieve
the same effect by selecting no cartridge (as you would for a 400/800).

This is mentioned in some Readme or other, I believe.

BTW: How is your mileage regarding sound in V2.6c? On my system Disk-I/O sounds
are a bit weird (mostly clicks and a bit of moise - no beeps!) and I'm not
sure about normal sounds either (I'm still trying to find out wether there's
a difference).

I was almost positive that the Sparta DOS distribution has an RPM checker in
it. I know they packaged it with SDX and I am pretty sure they left it in
2.3G or F or .4 or whatever it is.

Smoke stains are disgusting but at least they can be removed (if you can stomach it). Sun damage is worse though because the upper layers of the plastic actually turn yellow.

Yuck, here is the strangest thing, I took a good look at my nasty 810 last night, and it is starting to turn brown. Ewww, it looks pretty disgusting up next to everything else. What can kill a human can kill a drive, or just about anything else at that.

Sure you can. Sparta has fairly good support for everything else, it is just that everything else does not support Sparta.

That is, boot Sparta and you can access all your MyDOS, DOS II, DOS 2.5, type files, but boot any of those and your Sparta DOS format disks are not usable.

I think there are a few constriants, something like Sparta will not read or write to MyDOS subdirectories, but everything else works.

Back when I would write a bit of code here and there, my setup was pretty much two drives; a double density SD disk and a DOS II formated one, and a SDX cart. I would use the SD disk for program development<high speed and capacity> and write the finished code to the DOS II format disk when I was done<everything can read DOS II>.

Whenever I get a piece of equipment like that I immediately strip the casing and clean it. A bit of soap, scrubbing, and perhaps some whitening tooth paste will make it a new drive. Smells minty fresh too.

The 400/800/810 series were manufactured in light brown as opposed to IBM beige or the nice ivory for the 800XL/1050 series. Cleaning is fine, but you will never get that 810 anywhere near white without strong bleach or maybe paint.

-Ron

I don't have a solution but I admire the problem.

Well, I know that it is supposed to be sort of a yellowish beige color but I also know that it is not supposed to be mustard yellowish brown. Up against my clean 800 (beides that nasty dark brown stain that has been on it all these ages) and 400, it looks sick.

Hey, this is WAY off topic, but ...

Why do many of us write as if "becoming president" is something that just happens without our input? The likelihood of the candidate mentioned becoming president is pretty low. I don't advocate voting against someone, but since most will not vote for him, I have to assume that they're making a conscious choice not to do so.

Instead of moving away if he becomes president, how about convincing everybody you know of voting age to turn him down? It may not work, but at least you've done something.

Just a thought.

Maybe they meant something closer to "There is no reason to bother using SD with an 810" and I think you have a stock 1200XL<?> which means even less reasons to use it. Can't take advantage of double density or high speed I/O on an 810, no double densisty. The actual file structure is really close to every other DOS efficiency, something like only 3-5% more can fit on a disk, so it is really pointless to use it on an 810.

It is best on an expanded system, 256k XL or better, and in an envirionment where you have to switch context<if that is the right word> all the time. Great for things like running something like a text editor, ED/ASM cart, CC65, all the the same time and switching between them. It was also pretty good for the old BBS type envirionment where if you spent an hour learning hour to use it, it could save you 5 hours a week doing BBS matainance.

I have a Percom Data drive that will not read any disk unless I wipe the
head down with some alcohol and then let it dry for a minute or two.

I believe they were bought out by Diamond. The Supra name is still around,
but looks like Atari support will be kind of low.

There are limitations which might apply. If the mags were placed online
for educational purposes or for reference purposes and proper copyright
credit was given, there is nothing the publisher can do.

Try the Closer to Home site at cth.tzo.com ... the webop also runs an
Atari 8-bit BBS over Telnet that you can get on to. I also run a
large emulation-related FTP, specializing in things Atari.

I've been playing around for a few days and it's getting closer to completion. The man is moving inside the maze, not pretty, but updated each Vertical Blank and if I could get some animations on it too, that would be better. I hope and think this game will be finished. I'll put it up on my page when it is done.

Music suggestions anyone ? I was thinking I might add some samples too, but that would screw up any music I use. What do you think ? Music or sampled sounds (ouching and umphing and such) ?

I agree to Vidar's statement. This really sounds like 'LA SWAT'.

If you want to tell if the game you have seen is 'LA SWAT', it
would help if you remember this: A specific element from
that game is blind pedestrians, men with white walking sticks
getting in your way. And you can kill them with a gun shot!

LA SWAT is certainly a game that make one believe that the
1980's moralists' had a point when they were worried about
violence in computer games.

Basic XL is bank switched cartridge and would need major rewrite to work
from disk.

It's relatively easy to add its emulation to Atari800 emulator, the
description of cartridge is on my homepage.

But you would need the cart image first...

Hello Vidar,
answer: Music please !!! (no, not that sample from HTT, real 8Bit music
!!)
How about an AMS tune ??? Or something with german soundtrackers like
Soundmonitor Prof. 2.1 (by T.Karwoth), Benjy-Soundmonitor (Benjysoft),
Pegasus Soundmonitor (Pegasus, J.Schildmann), KE-Soundeditor (K.Ezcan),
Black Magic Composer (Gnome Design, S.Tegethoff), The Soundmachine
(forgot the authors name), Softsynth (??? remember World of wonders
!?!), or some polish soundtrackers like the Soundtracker, Chaos Music
Composer, Future Composer, Multi-Protracker, Theta Music Composer, Delta
Synthesizer, etc. (just examples)

greetings - andreas magenheimer

5129. How a HDI looks like...

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-17 00:00:00 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <399C1292.AD45386@mail.uni-mainz.de>
Source record: 42607

Hello,
for those that have never seen a HDI (high-density-interface for 1,44Mb drive connection to the A8) or want to know more about it look here:
http://www.atari-computer.de/atreju
choose german or english version and you will soon find some pics plus infos about this fine interface. Unfortunately (as I have heard), allthough a schematic and sources still exist for this interface you cannot build it any longer, since some chips are not avaiable any more...

(by the way, the HDI supported up to 4 drives, each with 1,44MB capacity and speedy ultraspeed !!) greetings - andreas magenheimer

Could be SWAT.

>Where I could download it?

I've played Hewson's Exolon on Spectrum, but I don't think they did an
Atari version. (Did Hewson do ANY Atari games?) The description
still doesn't ring a bell, though ... at least, no specific bells; it
sounds like a basic platform/shooter-type game ala Turrican (which
wasn't made for the 8-bit Atari).

>

Um... any idea who made this game? Fow what it's worth, I'm not aware
of any vector 3D-games (such as Driller, Castle Master, or any of the
other "Freescape" games) having been ported to the Atari. I think the
only reason they were even made for Spectrum was because that 3.5 MHz
Z80 was capable of handling vector 3D at a fairly reasonable speed,
while the poor 1.79Mhz 6502 just couldn't cut it fast enough to be
playable.

Source record: 42620

Is it possible to take a disk image of an atari 800 game. Lets say
the file is called mule.xfd. Can I take that image and somehow
recreate it on 5 1/4 floopy and boot it in a real Atari 800?

I have a PC emulator but I would rather play the games on a real 800.

Any help is appreciated.

Yes, if you can solder a bit and put together an SIO2PC it is almost
trivial. People sell them for $15-$40, but if you have an extra serial cable
you can probably scrounge the parts for less the $5 including a project box.

The XFD can be loading as a disk image into one of several programs that
simulate an Atari drive via the SIO2PC cable.

You really have two options, you can either use the duplicate disk function
of DOS to transfer it from the IBM to a real Atari drive/floppy or you can
boot an 800 directly from the disk image/IBM.

http://www.redshift.com/~cdyson/atari.html

For instructions. You will find links there to the software that runs on the
IBM side and maybe some that runs on an ST or Linux box.

Odd I bought Mules as a disk originally:

The 800 or 400 allowed 4 players and was GREAT I miss it on my lowley ST

Message-ID: <8niektkjn1@user2.teleport.com>
Source record: 42624
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,or.forsale,pnw.forsale,rec.games.video.atari,rec.games.video.marketplace
Body handling: HTML body converted to readable text

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/
Web info in my Signature attached to the bottom of any of my messages!

Please.
I want to see the pictures(snapshots) from different
game. I've got an emulator and trying to recall games that I played
8 years ago...
I remember Abracadabra, Montezuma, RiverRide, Mr.Do, Choplifter, Ninja
International Karate.
But too much left....
Do you know this games

1)
man walk upward the street and shooting bandits
(and sometimes citizens :-(( )
at the final he must shoot at the bandit which hold women.

2)
Cosmonaut go from left to right and shooting ball, vechicles,...
He can jump and crouch.

3)
Helicopter fly in the tunnels. Shoot wall, tank's, vechicles, ...

Hey, think of it this way...in the US, it is Primary season. No primary is going on, just a big party. Isn't a primary supposed to be the time to select the canadite for a specific party to run for president? We already know who was running back in may, now is not the time to sit around going "whohoo, Gore is running for president..."

Samples would be really neat. Many of us mute the music while playing anyway, it is usually pretty annoying. Samples, howver, would probably bring different dimensions of the game to life.

Good luck,
Jessica

Oh yes, NOW I see what they meant... use it on an XL (hardly in use since I love my big beige monsters).

I read your original post more carefully and I understood that you have
seen a Spectrum game, not an Atari game. The game I am thinking of
exists as an Atari conversion, and the visual impression indicates that
it is adapted to the Atari from a Spectrum game. I am very close to
recalling the title now, but not close enough. I will return to this thread
when I have found out what it is.

Suffice to say it isn't freeware then. I have seen Philip post that maybe
1/2 dozen times in different places and even got email from him to the
effect.
>
> : Is there a place where you can look this kind of information up?
>

I have read viturally every post to this newsgroup since 1989, I just don't
recall ever seeing this. I have asked for others if they have a copy of his
post saying the City is freeware and every single time I either get nothing
or a reference to Gary and him saying ~it is cool with him to distribute the
music. I think even the music distribution was OK with Phil.

I have a fairly good memory. It isn't that I don't wish Phil would say it is
freeware, it is just that everytime he had posted on the topic he said no. I
mean I clearly remember Gary, and I am pretty sure it was Dan Pinal. Only ~3
programmers on The Dungeon anyway so I couldn't have missed it by more then
2. I *WISH* it was freeware.

There seems to be some confusion about what I am asking for with respect to
copyrights. What I would like to see if the copyrights were assigned to
DataSoft for instance or if Phil retained all copyrights and just had
~limited term distribution deal.

This type of info is readily available for patents, I just don't know where to find it for copyrights or if it is in existance.

I mean it could be that even Phil Price isn't the legal owner of the copyright now if he sold his rights. In that case I would defer to Dan Pinal as the last available employee from DataSoft saying they are beyond caring.

Never played. How big is the file version and does it do disk access at anytime during the game?

It would probably be up someone like Video 61 to do the conversion if they could get the rights.

If the whole thing is <16k then it probably could be put on a cart by non commercial hobbyist.

Saw that before and asked for a source or copy of the ok, didn't get it.

Everyone pretty much just uses stuff like this, "I heard from my friend's
brother sister who dated Phils cousin that it is ok"

I don't have the original emails from Phil any longer, wouldn't make private
email public anyway, but he expressed his opinion rather strongly. IIRC that
he considered ARC still copyrighted and anyone downloading it a thief.

He may have changed his mind, I mean maybe Gary and Dan did, I just would
like to see the ref.

You see for me, I have been emailed directly by Phil about it, and I have
never seen anything that shows a change of heart. I'm not saying
www.ksk.sala.se/~rob/alternate-reality: isn't telling the truth, I am sayin
g I would like to see a direct quote from Phil. I mean if he got permission,
I would like to spread the news myself.

Someone else posted to the thread that DataSoft holds the copyrights. I really don't know, I would like to research it a bit.

I'll see if Phils email add is still good. I just did a ping on the server he used to use and it is still up.

> sales, either.

Never met him real life, but talked to a couple of people that did and
exchanged an email or three.

He is really tightly wrapped. Tempermental genius kind of thing. IIRC, when
he started work on AR online he disliked the existing 3d engines to the
point where he decided to write his own from scratch.

I think this was either posted in public or wasn't said in confidence
anyway. But Steven Lashower of Antic Music Processor AMP fame <and other
things> got contacted by Phil because Phil had copyrighted Advanced Music
Processor and called it AMP for short.

Gary Gilberson said Phil's AMP wasn't really like a music composing program
anyway. I think he said it was more like a macro processor.

It just seems that someone who would contact someone else because they
happened to use a name with the same abrieviation would have a change of
heart and say "The City is a freebie".

But then if Steven had named his progam Advanced Antic & Tunes he probably
would have heard from AT&T. That's Philip anyway. There are several stories
about him like that: Perfectionist, driven, that kind of stuff.

He's done of ton of stuff, programmer on the B2<1?> bomber computers, served
on a C standardization commitee<can't remember which>. He still hasn't got
all his bones in history/trivia: ARC was the first texture mapped 3d game
ahead of Id and Castle Wolfenstien although they get credit for it. They<Id>
ended up with Ferraris, not sure what Phil is driving.

I was just curious, was there a specific Bruce Lee movie this game was based on? I want to see a movie where a green fat guy moos along with a giant cow statue. I would also like to know what those little dots are supposed to be that I have to jump over. It would be cool if there was a movie that explained what these weird things are to make playing the game that much more fun.

Actually, about the only thing we agree on with respect to copyrights is you are allowed to obtain a backup copy of your original AR The City.

There is at least least one cracked version of AR The City floating around several web and ftp sites.

IMO, just get a copy and maybe an SIO2PC cable and have at it.

you'd have to have a termination resistor on the drive, if it is the only
one, I think.
About the only way I can think is to hook up the drives to a mio
that is known to work, ie works with some other drive setup.
Bob Klass is probably the resident expert on MIOs. He's listed
in the vendor FAQ.
hdfmtph6 was the only low level formater that I could get to work
with my typical seagate ST 225. Or maybe get an ST 225N, the
scsi one I think.

there are a couple things you can do.
you can get a cracked image and make a disk out of it.
or you if you could determine which sector has gone bad and try
to fix just that sector from someone that has an original (like me).
or you could maybe buy a new one from Ben Smith, or B&C or
other vendor in vendor list.

Missouri Atari Chapter? KODE-TV report (crosspost - need help)

Like throwing a boulder into a calm lake, we are getting ripple effects already. :)

I have already directed this man to Systems For Tomorrow. Now we need to fill in the gaps of anyone else in that area, state.. etc.. anything we can add.

Together we can help make a hell of a story for this man and his viewing area!

Doctor Clu / Greg Goodwin

5178. whatever happened to Dataque/ Chuck Steinmann

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-18 00:00:00 UTC
From: carmel_andrews@my-deja.com
Message-ID: <8nk3oc$kb5$1@nnrp1.deja.com>
Source record: 42643

I'd be very interested in whatever happened to Dataque/Chuck Steinmann (he of Gumby and T818 fame) where did he go, did his genius desert him

I'd also be very interested in what happened to the various proposed computer projects he was working on, namely mod's on XL/XE systems and turn them into new systems, I think there was an article or two in the dutch mega mags (I have the Originals, not the dodgy internet copies, which I'd been told don't work properly) about the new Atari systems he was designing
He even proposed turning an Atari into a PC and keeping PAG/PAC... (Figure that one out), he must have been pissed when he was dreaming up this system, or at least on something alot stronger then Anadin (or whatever they called it outside GB/UK)

While on the subject of themes American, I was looking for an original US version (which should work on UK systems) of CSS's 800 and XI versions of The Impossible and The Impersonator plus all the sattelite/component proggies that came with impossible, also Hacker or Crackerbook by Gardiner Computing (advertised in numerous Antics/Analogs, and ATARI roots (orignal and in GC, which I am willing to Pay £20 sterling for)... Any help would be apprec.

Keep those Atari's humming, I'm trying to find the nearest skip, or high rise with windoze, so I can dump the PC

Yours

Not sure that is correct for The City, maybe the Dungeon. We got kind of "That's ok with me" from Gary Gilbertson<sen?> and Dan Pinal later I think. That was music and Dan was one of<lead> the programers on The Dungeon for DataSoft.

Not sure about who retains copyrights for The City, but I would bet it is Philp Price. We really should have asked Dan for details when he came by. We have no idea what the Phil/DataSoft deal was, could have just been distro rights vs sale of copyright. Everytime I have seen Phil surface he has been very adamant about The City being copyrighted.

Is there a place where you can look this kind of information up?

5180. Re: i saw this game on the spectrum(may be it ported to atari)

I have a feeling that I have seen this game. Is it a one-colour screen,
a bright blue colour for all sprites, backdrops etc and a black sprite
outline and border? I can only recall the (Spectrum) game 'Alien 8'
looking a bit like this one, but 'Alien 8' was probably not made for
the Atari.

> rhamiiton5@aol.comedy.com (RHamiIton5) remarked:

>I will dig out that old AC; if you can access D9: then D3: thru D8: are
>certainly possible!

Feb '93 Vol 2 No 1 Atari Classics contains the article concerning a
modification for using D9: with AtariWriter Plus. Unfortunately, it is a mod to
an original mod for using SpartaDOS with AW+. The Sparta mod is not revealed as
it was at that time for sale at $5 from the Lehigh Valley Atari Users Group
(LVAUG, P.O. Box 796, Whitehall, PA 18052-0796). The original mod is based on
info in the Nov '91 Current Notes, if someone has access to it.

-Ron

I don't have a solution but I admire the problem.

5186. Help with MIO

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-18 06:35:35 UTC
From: Boyd Staley <BoydStaley@att.net>
Message-ID: <399CD8E9.95F17B3F@att.net>
Source record: 42633

I recently got ahold of an ICD MIO with 256K. I am having problems getting the hard drive interface to work. I have tried a couple of older SCSI Drives, a Quantum 40S and a Maxtor LXT-213S with similar results. (Both drives work fine when tested on my TT) After entering the HD Parameters into the MIO I run HDFMTPH where I have tried about every controller option and either the HD light comes on for a few seconds then goes out and nothing happens (seems to be locked up), or the light comes on and stays on but nothing seems to happen even after letting it sit that way for over an hour. In either case the red light on the MIO comes on and stays on.

If I select Save Configuration from the MIO menu the HD light comes on briefly and it seems to work but if I then power off and back on the configuration is not restored (the HD light does come on briefly when the CPU is powered on).

I have tried different parity settings and tried with and without termination, nothing seems to help. Cable orientations have been checked and are correct.

Any ideas what is wrong? Is the MIO really picky about what drives it will work with? If so what drives work (other than those in the manual)? I noticed that the MIO only supports 256 Byte Sectors while these drive hav 512 byte sectors but I assumed that would just cut the capacity of the drive in half.

Are there any parts inside the MIO that are subject to burning out? I noticed that the terminaing resistor pack inside is socketed.

Any help would be greatly appreciated.

Source record: 42568

Thank you for clarifying or at least posing the neccessary questions. I try to respect all copyrights, including all intellectual property rights. The problems of who holds these copyrights (Phil obviously wrote most of the code, but was bushwacked by his publisher) makes this all problematic and maybe unresolvable.

I must admit, however, I had been playing with the idea of downloading a disk image, tranfering it over with an SIO2PC cable to my real Atari. and had been wondering whether that would fall under fair use, provided no profit was made. Since the law is mostly vague about digital archiving(as they may be consdered bootlegs and Phil's own unverified comments- his intrests and wishes may not be best served) I will refrain. Since his wishes are in doubt I will take the most conservative position.

If he had been able to obtain full copyright or the company had released the game, this would have been much easier. Since the paperwork gets in the way and those with any interest at Datasoft don't seem to care and Phil seems unbudging in certain positions we may never come to any conclusion . Heck, I would even be willing to pay a small fee to Phil if it meant a clean conscience for me. :(Or if he would have a change of heart and release the 8 bit version into the PD , i'd personally kiss him if I ever met him :) I want to do what's right, but this is getting rediculous. It's all a shame, really.

Yes, there will be digital copies played on emulators, copied onto disks or cloned, but the spirit behind the game will ultimately die unless there is some change in stance.

Hello Boyd-
Very few imbedded SCSI drives can be formatted to 256 byte sectors and will work with the MIO. The only one that I am aware of is the Seagate 225N, and not even all of them. Do you have an MFM drive and an Adaptec or other controller you could try? Bob Klaas has mentioned at least one other SCSI drive that works -- was another Seagate model IIRC. As mentioned in another post, I would definitely check with Bob. I have been able to come up with some good 3-1/2" & 5-1/4 MFM drives at Hamfests, generally paying about $2 - $5 each. Of course, the controllers are a little more difficult to find, although I did run into a batch of controllers a year or so ago. Perhaps someday, someone will get the firmware or SpartaDos modified to read 512 byte sectors.

Unless you have a special device that has static ram in it (battery
backed), you cannot. One must burn an eprom which is then pluged in to
a cartridge board. Depending on the board, the eprom can be any size
from 4k to well over 1 meg.
Games like video 61 do, require a lot of work. It must be arranged
into 8k banks, stored in an order so they can be placed back into ram
again under control of a small program that runs at boot up from the
cart. If it has disk access, Even more work is required. Sometimes, it
may be impossible to do.

HDFMPH9 is the latest format program. Not sure if it will support your
scsi hd.
The only problem is to format it, once done, it should work fine.
Parity should be off and a terminator should be in/on.
Best seggestion is to find someone with a BlackBox and get them to
format the HD in MIO compatiabilty mode. The scsi drive should be able
to use 256 byte sectors. Older ones can. don't know about newer ones.

The resistor pack stays in the mio unless it is not at the end of the
scsi chain.
If someone is willing and able, the mio rom can be rewritten to use
512 byte sectors. Anyone? has anyone dissassembled the mio rom?

I recall reading that Datasoft put the clause in the contract that
said basically "oh yeah, we might have to tweak the program here &
there before releasing it, and that bit of programming expense will,
umm, come out of your royalties." So Price says "sure" and when he
calls back months later "I still haven't received a check," the answer
is that the tweaking expense fully consumed his royalties.

The legend goes that AR: the City was written in a shack thrown
together from scrap plywood on a remote beach in Hawaii. Price labored
there for months with no running water, on a twin Atari 800 setup
powered by an old gasoline driven generator.

In fact the giant poison rats in AR:the City are based on the rats
Phil had to fend off at night, to protect his dwindling rations of
Starburst fruit candies and tins of baked beans.

5193. Tuesday Night IRC Chat for Atari 8bit Users on 22nd August, 2000

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-19 00:00:00 UTC
From: DCM01@USA.NET
Message-ID: <399e94a6.10170800@news.CIS.DFN.DE>
Source record: 42574

This announces our third weekly IRC chat for Atari 8bit enthusiasts. It's scheduled for August 22nd, 2000, 10:30 pm Eastern US time. Here are the corresponding times for some other places, choose the one near you.

California: 7:30 pm. Colorado 8:30 pm. Texas 9:30 pm. London, England: 4:30 AM. Berlin: 5:30 AM. Hong Kong: 11:30 AM.

The topic for the chat will be "All about BASIC." and will focus on discussing the different flavors of BASIC, compiling BASIC programs to run faster, and the limitations of BASIC.

One of our participants plans to chat using ICE-T on his actual Atari 8bit this week, so we'll talk about that too. Wish him luck!

General Atari8 chat is also welcome. If 7 people show up, I will provide a doorprize. The doorprize is a like new copy of Preppie II by Russ Wetmore.

This will be a standard IRC chat. It is not a web-based chat on your browser. You need an IRC client, such as mIRC. The chat will be on Amiganet. Here are some servers that will get you there:

irc.whiterose.net
thule.no.amiganet.org
linux.us.amiganet.org
au, uk, se, no & us.amiganet.org

Once you log onto a server type "/join #atari8" and we will be there waiting for you I hope!

I think Frank Coen<sp?> "Coen's Tower" or some name like that, good game BTW, wrote an interesting article about the software industry back then. I think he worked for DataSoft and basically portrayed it as kind of a wild west/cowboy type outfit and working envirionment.

Here's the hap on the rewrite. I hope I remember the names right, but I believe it was Dan Pinal who said several of these things and info was available on CIS. The code Phil provided to DataSoft wasn't commented a lot. Genius thing coming into play again, Phil didn't need to comment thousands of lines of code because he could pretty much just look at it and knew what it was doing.

So they had something like a 3 member team working on The Dungeon at DataSoft and they also reqruited some famous names like John Ratcliff<MAT*RAT brother and programmer for 668 Attack Sub> to do the ST port of The City.

At that time DataSoft decided to make the program more generic vs specific for each episode they would release, so Dan said they did almost a complete rewrite of the source so it would be portable across platforms and reusable for sequels.

The numbers DataSoft tossed out for how much they spent on the rewite was either $225,000 or $250,000 which sounds about right for the number of programmers they had on it and the time they spent. But considering the size

of the Atari market at the time, you can only say, "WTF were they thinking spending that much money on an Atari game?"

I mean $225,000 was real money back then, if they would have told Phil they were going to dump that kind of money into it, he may have offered to program The Dungeon himself.

I heard the same, my memory is a little foggy but I seem to recall him also mentioning ~so humid, green mold growing on the walls<?> or his bed<?> or his computer<?>. But I think that was mainly for Tail of Beta Lyrie.

But a lot of us have stories like that from our early days. Back before I started getting patents for my pharmaceutical devices, I used to put in a 50+ hour work week and on weekends would have to cut firewood on the family ranch to make enough money to eat. Single parent making less then $1000 a month *gross*, but paying $250 a month child support to ex for child #2 while paying $225 a month day care expenses for child #1 who was living with me. Times were so tough that I even raised pigs: Fed them by dumpster diving behind grocery stores for rotten food.

One of those character building things. I wouldn't wish it on anyone else, but I am glad I went through it. Kind of makes these survivalist in their $30,000 sport utility vehicals and chemical toilets seem rather silly to me.<grin> They don't know what it is about.

re:copyright
Tasha. You said you have a bad original of AR City.
Copyright law allows you to back up your software (audio, video,
computer.). I think the law reflects the fact that tapes, computer disks,
CDs, VHS tapes, etc. go bad. Producers of such software do everything
they can to keep you from making a backup of your bought software.

What James said.

I still have a bunch of cart PC boards I got from Weird Stuff Warehouse. They used to sell them for a buck each. B&C Computer Visions and Best has them and cases too, but at a higher price.

The EPROMs that go in them are everywhere. JDR, Fry's, Jamco, all sell them new, but I have a ton of them I pulled from equipment. One of the best things you can do with an old AT is tear it apart so you can make a 256k XL, a few carts and maybe a new OS out of it.<grin> 2nd best is to use it slaved to an Atari as a SIO2PC or APE drive.

Not sure what the current prices are. I used to have a $150 Thompson Proburner for my Atari, but loaned it out and it came back broken. Then I switched over to a Needem Electronics EPROM burner for $119 for an IBM and never looked back. Thompson sucked for support, the one I got never worked as advertized. I still love Needem, great support and great hardware.

Only other thing I have is a really cheap UV eraser, paided something like $34.95 for it. Only erases 2 EPROMs at a time in about 5 minutes, but it takes about 5 minutes to program a 8k-16k EPROM so you don't spend a lot of down time.

So basically you are in the Atari cart programing game for ~$150-$200. I have seen JDR sell burners for as cheap as $50, but that is usually "returned merchandise, tested good".

I have failed before doing cart conversions. Things like programs that were 17k long and you only have 16k available to you. Round peg, square hole kind of thing. I don't do bank switched carts<one exception> so I gave up in these cases.

But one success that comes to mind is a SpeedScript conversion I did. Had to do a minor rewrite IIRC, eliminated the Antic mode 3<?> chr set so I could save 1024 bytes and managed to stuff it in a cart.

The Atari OS automatically checks for the presence of a cart on powerup. If it finds one, then it looks at few bytes in the carts memory area to see what to do and where to go. I just have those bytes say, "Let DOS boot, then jump to this memory area of the cart". The memory area I have it jump to just moves the SpeedScript program from EPROM to where it wants to run in RAM, then jumps to it. Only something like 41 bytes of programing to do this.

Once you have all that junk taken care of, merging the files, getting them to where your EPROM burner is, etcetera, you can make a dozen carts an hour if that is what you want. Raw material prices are a little high last time I checked at B&C, something like ~$15 for PC board and plastic case, but if you are a scrounger like me<see my dumpster diving post> you can make them for a couple of bucks each.

Your point about 3D is correct.

I have found out the name of the game I was thinking of.

'Chimera'.

It looks like a lot like a Spectrum game. And you drive a robot.

Anders

Yea, I took a look around, you could almost buy a cartridge for that much.

Dumpster diving? ha! Some of the best stuff is found in dumpsters, provided you have somwhere to hose the stuff down (furniture) or you have knowledge in the computer tinkering field (most of us here).

With regard to this blue/green problem, I got the AtariWin800 source and initial tests indicate I just have to change the palette (as someone else indicated).

Anyone know where I can get info on the appropriate RGB values to ues for each color/luminance pair?
TIA, Patrick

Yo!, or hello Atarians out there in Atari cyberspace, Hows that Atari thang going

Anyway, Re: the BBC2 tv proggie about the 70's, I've just seen this saturdays installment, and boy it wasn't bad

That's as long as you remember , the ford capri, The professionals (ITV TV series), the wombles, Ampex's VCR (which looked like the first LazerPlayers that pioneer and Phillips came out with in the late70's early 80's- same design), 6 million dollar man (I'm ashamed to admit I'd been given one of their annual's once as a child as a present), and ofcourse Home Pong from Atari, and the various clones and direct rip offs that Atari pong spawned
I couldn't quite make out what manuf's version was actually being shown (I don't think it was Atari's, Even though I have seen the original Home pong in a london shop)
What made the Program for me is when they interviewed Nolan (the man) Bushnell, who said that that was the best Atari could come up with, with the current (1974) technology
They also interviewed a so so tv personality, danny baker (ex 6 0'clock show), he claimed it beat today's games hands down

Anyone see the program

Happy Atari'ng

: effect.

Quoting from the Alternate Reality FAQ v0.9f, from
www.ksk.sala.se/~rob/alternate-reality:

"Disk images are files that contain dumps of real disks from other
computers. If they contain copyrighted material, such as a comercial game
for example, they should be considered illegal too, if you do not own that
game.

However, Philip Price, the copyright holder of the Alternate Reality
series has granted free distribution of the original AR games. That means
that anyone can enjoy them for free, but, original copies, manuals and
such, still may hold a certain affection and nostalgic value. Disk images
of the original Alternate Reality games are therefor not illegal to
possess even if you do not own the real game.

You will find Alternate Reality disk images for all of the below mentioned
emulators at ftp.ksk.sala.se/pub/ar/ (This archive is final. It contains
atleast one copy of every version of AR ever produced.)"

Parts or all of this may be apocryphal, but as I understand it,
Datasoft was bought out by Batteries Included, who then proceeded to
go bust. (Or were bought out by Activision or EA or one of those big
companies, can't recall which. It's been a long time since I was
told what happened)

But yes, Datasoft was a great company. They brought out Alternate
Reality, after all -- my favourite game of all time on any machine.
Pity about Philip's quest for the rights, though. The PC remake he
was working on looked quite good.

FWIW, the games in it aren't exactly rare, they're pirate copies and
clones. (i.e. Tomboy = hacked Pitfall; the Defender variants are also
hacks) That's pretty much all Rainbow Vision ever did were clones.
I think they did two original games.

No it isn't. Philip Price tried to gain the rights to it last year
when he was working on a new updated version of Alternate Reality for
the PC. Unfortunately the current holders of the copyright wouldn't
give it to him.

Bastards.

(Actually, Datasoft is to blame; they gave him the royal shaft with
the AR games, and it's been downhill since)

Hmm. Phil may have given the okay to distribute it, but he's not the
copyright holder. Back in the day, Datasoft owned the copyright to
the game. More recently, Philip was trying to obtain the copyright to
the game to do a PC remake. I'd visited his site from time to time to
observe the progress of it (and it looked quite good, too!) but
ultimately he failed to get that copyright, and the project appears to
have been dumped -- or at least shelved indefinitely. :-(

Sorry, I do own web space but only 100 megs, need that for my business site. I am working on a new site (Atari related) and I will likely purchase about 500 megs for it but that may be a ways off.

Of course, I will let EVERYONE know when it gets finished (again, it will be a while as it is going to be a unique perspective on the 8bit Atari).

> Can't stand the code-modification and banners and the other intrusive

Do not blame you. Free web space can be a real pain. For the time being, you could try searching for "banner free web space." There are many out there that are not advertising much due to lack of resources. It may take quite a bit of searching, however.

Ok, I have a naughty 850. For one, someone has inserted a CABLE JACK in one of the i/o ports. The interface has been stripped to bare bones, a dust trap. No red light. The problems I just mentioned I can deal with but the major problem is I cannot get the unit to work using a power supply of any type.

If anyone has a spare interface, I would like to make a trade. I am willing to give up two 800XL's (cannot verify the working condition of either) and a 1010 program recorder. Depending on the amount, I am also willing to pay, but trade is preferred. eMail or post to make an offer.

Eucalypt Software - Makers of Autopost & Rocketfuel --- Ripped Me Off!!!
-
All potential buyers should be warned to steer clear of this company. They have a repeated pattern
of ripping people off and ignoring requests for support.
-
I know someone who sent in the $10 registration fee for Autopost TWICE (thinking the first one may
have gotten lost) and in both instances, never got a registered version of the program and all of his
emails were completely ignored.
-
I myself purchased Rocketfuel on-line and had to pull teeth to get an unlock code. The web site was very
quick to take my money, but no registration/unlock code came for days and days. I repeatedly emailed them,
only to receive nothing but autoresponses. After 5 days I sent them a message stating that if I did not have
a working version of the program by the close of business that day, that I would challenge the credit card
charge. Magically, the code arrived several hours later.
-
What kind of way to do business is that?
-
In any case, its academic... there are other products available for free that do virtually the same thing
and I only wish that I had known about them before I wasted my time with Eucalypt Software.
-
If your in need of automatic news posting software, there is nothing better than "NNTP Power Post 2000".
It's graciously been made available free from the following web site:
-
http://net-toys.8k.com/
-
Save your money... your time... and the aggravation!
-
Peace,
-
PPN
-
-
PS: I have no affiliation with the makers of PowerPost 2000.

Hello All,

I was looking through my 8-bit stuff and found an old beta game I was
testing for the Nexa Corporation. I was called All Pro Chalkboard Football.
I believe this game was scratched for the 8-bit and later came out for the
Amiga/ST. I think it was called All Sports Football.

That was me, I think. :-)

> Anyone know where I can get info on the appropriate RGB values to
> ues for each color/luminance pair?

That's a tricky question to answer, because the appearance of each hue/luminance pair will vary depending on the way the tint, brightness, and contrast are set on your TV, as well as whether you're using NTSC or PAL. Apparently even the individual Atari can be a factor, depending on how the potentiometer is set. I used to adjust my TV settings to get what I thought were the best hues, based on what the references said they were, and to make the luminances distinguishable from each other. I wrote a simple program to display all 256 colors on the screen at once, using display list interrupts. Whenever I wanted to adjust the settings on my TV to get the best display for my Atari, I would run that program so I could see all of the colors at once while adjusting the TV settings.

Unfortunately, my Atari disk drives died long ago, and I never replaced them, so I can no longer run my old Atari programs. Several months ago I bought a Snappy! digitizer for my PC, for the sole purpose of capturing Atari screens on my PC so I could determine which RGB value to use for each hue/luminance pair. I played with the brightness and contrast settings of the Snappy! program to make each luminance distinct, but I don't think I adjusted the tint. And instead of capturing all 256 colors at once, I just captured all 16 luminances of the hues at once, but I'm not sure if the colors are accurate. For example, I remember hue 15 as being brownish, but the screen captures I made show it as greenish, which isn't right. One of these days I'm going to play with Snappy!'s settings to get a better result on *all* of the hues and luminances, then make a new set of screen captures to work with.

Anyway, I think the hue you're most interested in is hue 10, variously described in the Atari literature as "blue-grey" (Mapping the Atari, p. 164), "turquoise" (Atari XL User's Handbook, p. 215; Atari 400/800 Basic Reference Manual, p. 50; and GTIA Chip NTSC, sheet 4), or "blue-green" (Atari System Reference Manual, Chapter 8). The Atari800Win and Stella emulators display hue 10 as greenish, rather than bluish. All you really need to do is redefine the RGB values for color 160 (hue 10, luminance 0) through color 175 (hue 10, luminance 15). At least, those are the only colors you need to worry about

"with regard to this blue/green problem." As someone else indicated in another post, Star Raiders uses color 160 (hexadecimal A0) for the background when shields are in use. Thus, if you change that color, Star Raiders on the Atari800Win emulator should look more like what you're used to seeing on the Atari.

If you do a screen capture of all 16 luminances of hue 10 (as I did), you can pull it up in a paint program and inspect the RGB values, then change the palette in Atari800Win. That sounds simple, but it turns out to be complicated. The screen capture I made of hue 10 contains 5173 unique colors! When I cut luminances 1 to 15 out of the image, the part of the image showing just color 160 (luminance 0) still has 432 unique colors! So I reduced the cropped image to a depth of 256 colors, optimized to the nearest colors, resulting in 20 unique colors. I reduced the new image to a depth of 16 colors, optimized to the nearest colors. Finally, I examined the RGB values of these 16 colors, added them together, and divided by 16 to get these averages: R=0, G=43, B=130.

When I create a color with those RGB values and put it next to the original cropped screen capture of color 160 (in all of its glorious 432 colors), it does look like a pretty good fit. However, the RGB values I came up with depended on Snappy's settings when I made the original screen capture, the way I reduced the color depth, and the way I averaged the resulting colors together. (I assumed that the 16 colors were used in equal proportions.) It's likely that someone else could use this same technique, yet end up with different RGB values. And then there's the issue of NTSC versus PAL colors.

Nevertheless, using the technique described above, I came up with the following RGB values for the 16 luminances of hue 10:

color 160 (hue 10, luminance 00) : R=000, G=043, B=130
color 161 (hue 10, luminance 01) : R=000, G=055, B=144
color 162 (hue 10, luminance 02) : R=004, G=074, B=156
color 163 (hue 10, luminance 03) : R=025, G=085, B=163
color 164 (hue 10, luminance 04) : R=044, G=100, B=172
color 165 (hue 10, luminance 05) : R=062, G=115, B=185
color 166 (hue 10, luminance 06) : R=082, G=129, B=200
color 167 (hue 10, luminance 07) : R=099, G=147, B=214
color 168 (hue 10, luminance 08) : R=104, G=154, B=213
color 169 (hue 10, luminance 09) : R=121, G=169, B=232
color 170 (hue 10, luminance 10) : R=138, G=185, B=246
color 171 (hue 10, luminance 11) : R=151, G=203, B=253
color 172 (hue 10, luminance 12) : R=167, G=219, B=255
color 173 (hue 10, luminance 13) : R=182, G=232, B=255
color 174 (hue 10, luminance 14) : R=198, G=247, B=255
color 175 (hue 10, luminance 15) : R=216, G=255, B=255

The most recent version I have is HDFMTPH8.com that I got from
the CTH archive. If someone could send me a more recent wersion
I would appreciate it.

I don't know anyone with a black box but I think I have some
utilities for my TT that can change some of the configuration
on the drive. Maybe I'll play around with that.

Boyd

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

This is not the case in the UK at least. Fair use (for journal articles) amounts to making a single copy of a single article from a single issue of a magazine *for personal use*. You can copy two articles from two different issues, but not more than one from a single issue. You can't re-publish or distribute without getting permission/paying royalties. Educational institutions make Copyright Licensing Agreements to allow for class sets etc to be copied and fees paid appropriately. You can also get inter-library loan photocopies of articles for loan to users (as opposed to single copies for individual users) but you pay an extra charge for copyright clearance.

> I am not a lawyer, but I do run a business and have to knwo at tleast
a
> little bit about these things.

I am not a lawyer either, but I am a librarian and it is part of my job to know the guidelines on fair use for photocopying (as opposed to the small print of the law on copyright, though I have colleagues who have more detailed knowledge). Re-publication is forbidden completely unless you have clearance from the copyright holder. Isn't the US now signatory to the Berne convention (think that's the thing...)? In which case you might find the law is tighter over there than you think, but I can not speak authoritatively on that.

BTW (and this is not a personal remark or intended to be offensive in any way, just an observation) in my experience, business people are remarkably cavalier in their attitude to copyright. Though this may be more of a reflection on our business studies students...

Indeed. I write for Computer magazines in the UK and (usually) own
copyright on anything I write. Any thing I write is subject to a fee
should someone else wish to use it, even in an ad or something.

yup! It's not often you see the Atari name on TV these days. What struck me was all the things that were shown on the program as being so fantastic and new back then are so taken for granted now. There was a part where they were showing someone how to use a Pong machine (move this lever and press this button marked start when you're ready to start!). Compare that to today's games.

Well, when you post some more of your stuff, mark it FA (For Auction).
FS: means for sale. It's not the same thing.

5241. Going APE!

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-21 00:00:00 UTC
From: Michael Gale <mgale@bitflash.com>
Message-ID: <eHgo5.1258$Td.33289@news.magma.ca>
Source record: 42461

Hi,

I am trying the APE interface and software (Windows 95/98 version) and don't seem to be having any luck. My second COM port is free from conflicts. From my understanding, I just load a disk image (ATR file) using APE, and then turn on the Atari. Voila! It should not be able to tell the difference between my PC and the Atari disk drive. I am also assuming the program I am using has the necessary DOS files to boot on its own. Any suggestions? Am I forgetting something?

Thanks for your help,
Michael

You do not specify what happens... if it is "Boot Error", make certain the .ATR
does contain DOS or otherwise bootable code.

-Ron

I don't have a solution but I admire the problem.

No, at least to my knowledge. The chalkboard comes from the fact that you
were to design plays on what looked like a chalkboard.

>way onto the atari, what about molecole man or head over heals (I have
>both on tape)

I had and played both. Head over Heels even made an appearance in an
Atari ST version. I rather liked games that took advantage of
Graphics 8 artifacting, though. It was a subtle but very cool art
form. I remember a demo that appeared either in a magazine or book I
had way back that showed how to get something like 30 or 40 colours in
graphics 8 by varying the angle of lines. It was impractical for
anything but that specific demonstration, but it was interesting
nonetheless.

Yep, that's another one - also using artifacting on the Atari. It was
quite a cool and original game -- loved the music.

The Atari boots normally, and doesn't seem to notice APE. APE establishes a COM port connection successfully. The ATR I have loaded is DOS version 2.6f. Other than that, no other messages. Does that help?

Probably cable.

Do you have a DVM or VOM to check the cable/IC pins?

Hello All,

I succeeded in hooking up a 130XE to a SVGA monitor. I ordered the cable from B&C and the converter from a place in Illinois. I was able to get sound and everything. I was very happy and the people who were there were impressed and surpised. I could not get the Chroma option to work. The screeen would come on and then go off, so if anyone has any ideas I am listening.

Just to clear up some confusion, software can be distributed as
freeware while still retaining its copyright. If software is
released into the public domain, then it loses its copyright.

Hi!

I bought an atari xe game system from a flea marked. I came with a number of carts. However, only one of the cartridges work(desert falcon), and when I start the system(without a cartridge) the screen goes blank. I remeber from the old days that it should have missile command build inside.
What is wrong?

Kasper

Missile Command is started when you press SELECT when you boot I believe.
But, what do you mean blank screen ? Screen with READY prompt or black or
what ?

Take care

Well it is completely black, nothing happens.(I don't have a keyboard so I guess(which as far as i remeber contained the basic rom). I thought first there was something wrong with it, but if it was, then why do desert falcon work?

That's really weird. BASIC is in the console itself. Maybe it's the BASIC ROM that's bad and not the OS ? Don't know. Which other games did you try ? Did you get Missile Command to work ?

I did only get desert falcon to work! but it's kind of wierd, if the internal
rom didn't work, then I guess desert falcon shouldn't work either....Are you
sure that the basic rom is located inside the xegs system? I thought it was
located inside the keyboard(somehow :)

(beep) I don't think so! But I haven't really checked it either :)

this is really a puzzle

With the keyboard connected and no cart, basic boots, with out a
keyboard connected and no cart, the built in game runs.
There is only 1 rom in the xegs, it has the os, basic and missle
command on it.

Perhaps the contacts are dirty on the carts. I use a rubber to clean
them up. Don't use an ink one. Blotting paper also works.

Make sure you have the 'Control Method' set to DSR. If this is set
incorrectly APE will not 'see' the Atari. In the windows version this option
is on the first configuration tab. In the DOS version press 'Z' for the
configuration menu, its one of the first options on the list.

Once upon a time <39A3C478.E8904C24@ifi.uio.no>, Jan Kasper Martinsen
<janma@ifi.uio.no> grabbed chalk and scrawled:

>Well is this an internal rom? i don't understand. the screen is
>completely black! unless the desert falcon is inside?

Your internal ROM is faulty. If it is socketed, reseating the chip may
help, removing and cleaning the contacts on the chip may be required.

The keyboard merely forces the XEGS to boot BASIC in place of Missile
Command. The external cartridges should override the internal game.

Richard

I think that is what I heard as well. Keep trying, my friend, and it may well start to work one day. I have found that many Atari units seem to go "Offline" (xl's and xe's especially) if they have not been booted for several years. Somehow, the 400/800 computers (not counting the periphials from that era) do not do that as much. Wonder why?

Perhaps. If you do not have blotting paper or rubber, you can use a cloth (in the US we have these things called "Swiffer Sweeper" cloths that attract dust and such, I have used them with much success) or, even better, clean using a solution of one part rubbing alcohol and two parts water and rub on with a cotton swap and let dry and wipe with a cloth.

I know a lot about what cleans Atari perts well, I have had many die or not function correctly without a cleaning. Keep your 8bit clean and it will be a workhorse past "drinking age" and beyond.

Jessica

Hey! I should have thought of that, it makes perfect sence. Anyway, once again, CLEAN IT! Since the unit is more than likely vented, it will become a dust trap. Resoketing is not a bad idea either, older computers have a tendency to need their connections re-connected occasionally.

> The keyboard merely forces the XEGS to boot BASIC in place of Missile
> Command. The external cartridges should override the internal game.

Yes, like every other Atari system, including the 400/800 with "NotePad." Try cleaning your cartridges, like I said, and clean the ROM. Hopefully *my fingers are crossed* this will fix the machine.

Jessica

5276. Atari music Composer?

Newsgroup: comp.sys.atari.8bit

Hey all,
Do any of you have any idea about Atari music Composer. I mean, I am pretty clueless about it, no real idea on how to use it. I know you boot the cartridge, Type in the code, etc.

I guess what I am trying to say is : Is there any difference between composing in Music Composer and composing in BASIC? It seems about the same. Thanks,
Jessica :)

From the symptoms it could be the MMU too. That would explain the problem
with memory mapping the built in carts and why a lot of them don't work.

Hi Jessica!

Atari Music Composer cart is a first generation GUI music entry and playback system. I remember trying to use it a long time ago. I quickly became frustrated with it.... basically the sluggish way of entering music and the fact that it seemed to loose synch during playback. However, the graphic display of notes was kinda groovy.

Programming music in BASIC is probably the most tedious thing you can do to yourself. You'd be more productive watching cars go by on the interstate. You type in a huge data table of pitches and durations and write a simple loop to play the voices back asynchronously. Not my idea of fun.

If you want to enter music into your Atari, I'd recommend using Lee Actor's Advanced Music System (AMS). The first version is written in BASIC, so it is kind of sluggish. AMS II is written in assembly, so it's a little fast. I wrote a program called the Antic Music Processor. It's written in assembly as well. Not to mention, I just had to throw in a shameless plug =)

Hope this info helps,
- Steve

I was thinking they had something equivalent to the 16L8 PAL doohickey in
800XLs. IIRC, they feed that thing with stuff like CART flags to
enable/disable basic. There is one more level of glue in there, I think,
they run it though a 74LS138 to divide up the hardware region a bit<page>.

Those puppies do burn out on occasion.

5281. Re: TECH: RGB Values for Color/Luminance pairs

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-23 00:00:00 UTC
From: JTKirk <no_me_j.j_t_kirk@geocities.com>
Message-ID: <1da9qsgdj9mojn2sfv93f5u2n02hdqsgue@4ax.com>
Source record: 42501

My approach is somewhat different...
I did write a program that would siplay all 256 colors at once, too.
In fact, I wrote a whole TV calibration program. Even recently I
started to add a couple nice extra features to it.
Well, my idea was this: try to establish the correspondence
between the A8's hue and luminance values and actual TV hue,
luminance and saturation values. I mean, hue is expressed in
degrees, saturation in % and luminance in % or levels...
I (somewhat arbitrarily - having the proper equipment would have
yielded more accurate results) assigned color hue 1 to yellow,
4 to red, 6 to magenta, 9 to blue, 11 to cyan and 13 to green.Hue 2 was left
unassigned, but then the following hues fell near the following
axes:

3 +I
5 +V
7 +Q
8 +U
10 -I
12 -V
14 -Q
15 -U

With the PC it's a little easier since you can get equivalents
for RGB values and HSL values with many paint programs. IIRC, they
have hue=0 for red with values ranging from 0 to 239 (240 for
lum and sat). Then think of the A8 as having saturated colors
(at=100% or 240 on the PC), do the following equivalences:

Hues:

A8 PC
01 048
02 032
03 016
04 000
05 224
06 208
07 192
08 176
09 160
10 144
11 128
12 112
13 096

14 080
15 064

(I see I should have chosen green=14 instead of 13)

Luminances:

A8 PC
00 000
01 016
02 032
03 048
04 064
05 080
06 096
07 112
08 128
09 144
10 160
11 176
12 192
13 208
14 224
15 240

This is somewhat simplistic (0 is always black and 240 is always
white on the PC), but...

For the saturation, for hue=0 on tha A8 make it sat=0, for any
other hue sat=240

Just FYI, I just tried connecting the composite output of the
A8 to the composite input of my TV tuner card on the PC and grab
some frames... unfortunately I didn't get "pure" colors, either
(though I have the advantage of having the PC conncted to the TV
as well)

Does "normally" mean to the "READY" prompt without DOS or does a real drive set
to D1: provide the DOS? Which drive number is configured for the APE?

-Ron

I don't have a solution but I admire the problem.

>is there by any chance a GUI to run on the Atari 8 bit computers?

There have been at least 3 over the years; Diamond by Alan Reeves (late '80s) was probably the most successful - it was on disk at first and then in a cartridge. The name of its main competition escapes me at the moment. There is another is in development; occasionally it is discussed here and on the 8-bit mail list.

-Ron

I don't have a solution but I admire the problem.

I find, being used to Lynx on the Victoria Freenet, that even on a
friend's cable modem, when I want to find something, I log on to Freenet
via telnet and use Lynx. No popups, no scrolling and flashing
ads--beautiful! Definitely faster and the option to view just the URL's
on a page can often get me where I want to go faster. About the only
things Lynx doesn't handle are SHTML and JavaScript.

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Thanks again, guys. :) I must admit i'm more familiar with the Atari from a hardware, rather than a software point of view; though they do of course interconnect and I am now learning assembly for the Atari. I find the legal wranglings of this very fascinating. I've dowloaded a disk image and will go about seeing if I can pop down to ole Radio Shack and find the parts needed for an SIO2PC cable and get it tranferred and running on my lil 130 XE. I'll report back on my success:)

Tasha

Hey there!

Are you working on anything particular ? Just wondered if you would like to co-operate on a game or something ? I am currently working on Box World for the Atari 8-bit. My demos and source are located at : http://home.online.no/~olavese/atari/a8dl.htm

Let me know if you're interested in that. I have to say, graphics and sound is very weak point of mine. I can make the graphics move, wobble, start music players in assembler, but I am not good at composing and drawing.

Take care

BTW : This goes to all Atarians still coding.

AMP's a fantastic program! I gave up my Atari system in December, and one
of the few things I regret not doing was creating .ATRs of all that stuff.

Now I'm collecting .KARs (Midi Karaoke files) for the PC and thinking back
to AMP as something we could have used to accomplish the same thing.

Oh, well ...

I had an XE system that seemed to have a "loose" or "dirty" set of
contacts. Try cleaning the contacts of the carts and the unit and if
you get a black screen, power off the unit, remove and reinsert the
cart, and try again...

>

Hello Vidar,
only Think and Work, Push it and a few others are PD, all others (Sogon from KE-Soft, Sokoban from Compysoft, Sisyphos from Oddware - a demo exists with 4 playable screens- full version is not PD, the polish one from Sonix and others) are commercial stuff, so I will not give them away or make copies (images). Ok, maybe the Page 6 one (Orson+editor) is also PD, since Page 6 seems not to be alive anymore ...

(I paid for the last 6 issues in 1999; now its already 2000 and I did not get even one issue... and since most other british dealers are gone, maybe Page 6 left us too !!) greetings - Andreas

Immediately !!
Although I already own them on disk I would love to buy them on carts too...
How about other Datasoft productions, like Moon Shuttle, Gunsmoke (Gunslinger), Dallas Quest, Neverending story (still hunting for the disk!), Zaxxon (Sega, also released by Datasoft), Super Zaxxon, Pacman (with interludes or intermissions), Thomahawk (originally by Digital Integration, released by Datasoft also), Mercenary (originally from Novagen), Drol (was it Datasoft or Broderbund? must have been Broderbund since its only b/w on PAL, like many other Broderbund games), 221B Baker Street, Porky and the wolfes (damn, I just forgot the name, but I have it on disk!), A.R. The City and The dungeon (would need an elite/super professional programmer to get them onto a cart) and many more I do not remember now... -Andreas

Use a flash-eprom, so you can "write" to a cart (but really you are erasing some programmable ROM area, lets say 16k byte; you cannot just save 1k this way, you have to erase the whole 16k first and then save to it;). But the Atari carts already gave us a much easier way to do it: boot up a DOS-disk !!

You just have to set a certain byte in the cart code and thus it is booting up a disk. remeber all those languages on cart, like Basic, Action, Logo, Pilot, etc. or games like Rally Speedway, Gato, etc. or tools like Micro-Illustrator, Atari Artist, Atari graphics, etc. they are all able to boot up a disk and save certain things (graphics, hi-scores, listings, etc.) to it... So if you want MULE on a cart, just let it boot a (DOS) disk, so one can save any data onto disk

(But it is also possibble to save data to an eprom, but not so easy or user-comfortable; here in Germany we are currently creating a 512k Flash-eprom, it will be sold at ABBUC-JHV in Herten at october; with this thing you can copy/save whole disks to cart and so on...)
greetings - Andreas

Did "Capture the flag" (the 3D game from Synapse, not the 2D one from
Antic) have any texture-mapping ?? I liked that game and would have
loved to see broderbund (who had taken over Synapse) re-release it (and
then Atari re-re-release it on an XEGS cart, like they did with other
Broderbund games, haha !!). - Andreas

Well,
with a flash-eprom you do not need any batteries, just erase a certain ROM space (if your cart is divided into 16k parts, you have to erase at least 16k; if it is divided into other parts it may be more or less) and then copy/write/save your wished program data onto it. Of course you need a kind of program that is able to do this, but you can just put this program onto that cart (as a sort of OS). To erase an eprom you normally need ultra-violette light, but with a flash-eprom you just need some volts - and believe me the XL is able to do it !! This means you can erase and write a flash-eprom inside your XL cartridge port... (I know it, because we are currently doing it with an 512k flash-eprom !!)
greetings -Andreas

Besides,
Amaurote if that counts, also... (what a great graphic, what a nice sound, what a boring game - Amaurote !!). And Mad marbles/Marble madness and all its clones (Spindizzy, etc.). Maybe Shanghai is also kind of 3D (ahem), Taipei (another commercial german Mahjong clone) is much better
- Andreas

1) the Asskicker (from Shadows), the part before the last part... (the
pre-last part ?!?); (demo needs 128k; boot with SELECT for hidden part)
2) Stash-Demo (from ???) only the intro "portrays" windows, the rest is
pictures (in good old Gr. 9) and a (marusha) techno-tune... (Demo needs
320k to run all pics from Ramdisk);

-> check out atari-area.prv.pl (or so) for newest demo stuff... -Andreas

Yes, but that (damn!) color-artifacting does not work at all on PAL
systems !!
Damn you Broderbund, for using it so often... -Andreas (Germany,
PAL-country)

P.S.: The game and demo guys of the 90`s did the same with many PAL
programs, they used PAL depending techniques (like overscan routines,
that merely work on PAL), so these programs cannot run on NTSC machines,
hehe !!

5307. Re: GUI for atari 8 bit?

> Thanks!
> Steve B.

Just tell me how many you want... !?! Ok, to be serious, i know these
GUI`s:
- Diamond GOS (1, 2, 3)
- G.O.E. (2 or 3 different versions)
- G.O.S. (2 different versions)
- SAM (one type-in listing, one commercial version)
- TOS-XL
- BOSS XL and BOSS-XE (and now: BOSS-X !!)
- some other PD programs

most of these programs are only demonstrations; afaik only SAM and
Diamond arrived as "usable" tools... -Andreas

P.S.: If you mail me, I can send you ATR images of these GUI`s !!

Maybe, the guy who sold you the XEGS kept the Missile Command chip...
(and thus the OS and Basic, since they are one chip; hmm, how does
desert falcon work then ??) - Andreas

P.S.: Try the XEGS manager, if you have a floppy (and er, a keyboard!)

The XEGS ROM holds a) the OS, b) Basic, c) Missile command. its one chip
(of 32kbyte) !! The keyboard only holds an adapter plus the keyboard
keys and console keys (the console keys are also inside the XEGS console
- just open it !!)
-Andreas

Hello,
and besides AMP is free (since Antic disks are PD!), it will not cost
you anything. And AMS sounds can be converted to AMP and karaoke-like
texts can be added !! Cool thing, I like it (and already converted many
AMS files to play them back with the AMP auto-music-player). -Andreas

When you`re in trouble in re-collecting these AMP files, just ask me, I
have a "little" AMP collection here. Can convert these to images, but
they would create some megabytes (even when zipped)... -Andreas

P.S.: I refer to AMP as "Antic-Music Processor" not that Gary Gilbertson
one...

Are you sure your right about that ? I think Gilbertson wrote several tunes on the Antic-Music Processor. There's a demo disk with a few tunes on it. I think I have three disk sides with Gilbertson music. Wait, four, the Alternate Reality music demo too.

Gilbertson did use an editor where they coded all the stuff. Not a real editor.

Notice I said "Let it DRY!" Y'know, there is a reason for that. And, some of us, like myself, do not know that there is such a thing as "contact cleaner". Besides, it will not rust unless you clean it every other month or more than that. I was reffering to a yearly cleaning. Perhaps I should have been more specific. Or just use straight alcohol.

Goonies is awesome too, but Bruce Lee is the first one I discovered I had in
my collection, played it a lot, then I weeded out my disks and found Goonies,
Zombies, and a ton of others.

Hi,
So, I know that several of you are on the newsgroup VIA your atari.
What I want to know is:

1) Is it easy to use? What type of browser are you using? (I know the internet for you will be text based)

2) Does it take forever for pages to load?

3) Are the websites that you visit somewhat limited in content due to heavy graphics usage?

4) Anything else I should know?

Dr. Clu and I are trying to set up the connection; I am taking care of 14.4 modem and he is taking care of the interface. I just want to know what it will be like when the day comes that I can surf the net on a computer that is older than I am (!, and it still works!).

Jessica

Lynx for a browser. Text only, kind of archaic interface, reminds me of
using an early version of WordStar.

Ditto for newsreaders, easy to get to once you have you login you shell
account.

I mean type lynx or rn or tin at the command prompt to launch Lynx, Read
News.
>
> 2) Does it take forever for pages to load?

Much, much, much, much, mucho, faster. Graphics slow everything down by an
incredible amount. Down side is not all web pages are text only friendly.
>
> 3) Are the websites that you visit somewhat limited in content due to
> heavy graphics usage?
>
> 4) Anything else I should know?

Just that 2400 baud is probably enough. I type maybe 300 baud and read 2400.

You never said if you got SIO2PC working, but it is kind of neat to ftp from
a shell account to someplace like archive.umich.edu and down load software
directly to your Atari, no IBMs are harmed during the transfer of this data.

5321. looking for a game

Newsgroup: comp.sys.atari.8bit

Has anyone heard of a game for the 8-bit Ataris called "Batty Builders" (I think that was the title). I have not played it in years but I know I had it for my 800xl. I may be wrong about the title but the idea of the game was to grab falling blocks from a scrolling conveyer belt and throw them back up to arrange them by their design.

Dominik

5325. Re: TECH: RGB Values for Color/Luminance pairs

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-24 00:00:00 UTC
From: JTKirk <no_me_j.j_t_kirk@geocities.com>
Message-ID: <8ra9qskjo9vu6q9pbiqh5cu2rfok65fqsg@4ax.com>
Source record: 42537

My approach is somewhat different...
I did write a program that would siplay all 256 colors at once, too.
In fact, I wrote a whole TV calibration program. Even recently I
started to add a couple nice extra features to it.
Well, my idea was this: try to establish the correspondence
between the A8's hue and luminance values and actual TV hue,
luminance and saturation values. I mean, hue is expressed in
degrees, saturation in % and luminance in % or levels...
I (somewhat arbitrarily - having the proper equipment would have
yielded more accurate results) assigned color hue 1 to yellow,
4 to red, 6 to magenta, 9 to blue, 11 to cyan and 13 to green.Hue 2 was left
unassigned, but then the following hues fell near the following
axes:

3 +I
5 +V
7 +Q
8 +U
10 -I
12 -V
14 -Q
15 -U

With the PC it's a little easier since you can get equivalents
for RGB values and HSL values with many paint programs. IIRC, they
have hue=0 for red with values ranging from 0 to 239 (240 for
lum and sat). Then think of the A8 as having saturated colors
(at=100% or 240 on the PC), do the following equivalences:

Hues:

A8 PC
01 048
02 032
03 016
04 000
05 224
06 208
07 192
08 176
09 160
10 144
11 128
12 112
13 096

14 080
15 064

(I see I should have chosen green=14 instead of 13)

Luminances:

A8 PC
00 000
01 016
02 032
03 048
04 064
05 080
06 096
07 112
08 128
09 144
10 160
11 176
12 192
13 208
14 224
15 240

This is somewhat simplistic (0 is always black and 240 is always
white on the PC), but...

For the saturation, for hue=0 on tha A8 make it sat=0, for any
other hue sat=240

Just FYI, I just tried connecting the composite output of the
A8 to the composite input of my TV tuner card on the PC and grab
some frames... unfortunately I didn't get "pure" colors, either
(though I have the advantage of having the PC conncted to the TV
as well)

You are working with Clu, so I guess he's about as knowlegable as
anyone on the A8 and the internet.
AFAIK there is no browser for the a8. You can do some internet
stuff with a shell account. I don't know why anyone would want to,
actually. I am interested in it, just to know what can be done.
There is a html text viewer for the a8, a far cry from actually connecting
ppp tcp/ip and viewing web pages, even text only.
So, if you really want to use the a8 for internet stuff, to my knowlege,
you have to have an ISP that allows a shell account, then use lynx
for connecting to web pages, tin for newsgroups, elm or pine for e-mail.
Good luck.

Yes, that is a problem. I am an active eBay user and I am concerned that it
will not be text friendly. Can anybody let me know?

Really? Hmm, I guess that means that I can save a heck of a lot of money modem
shopping. Not too many 14.4 modems that are not fax only.

> You never said if you got SIO2PC working, but it is kind of neat to ftp from

> directly to your Atari, no IBMs are harmed during the transfer of this data.

No, I haven't had time to get it to work. School is putting a big damper on it. The thing that I was mainly going for when I wanted to get my 800 online was the fact that downloading disk images would be a lot easier (esp. considering that I have one of those giant towers that is hard to get in the back of), besides general PC hating tactics.

Have you ever played "MineField"? It was on an Antic disk from around 85-86, just blocks and a ray to shoot through them. And I thought 2600 Pac-Man was bad... However, the game is very challenging.

5330. Re: Atari music Composer?

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-24 00:00:00 UTC
From: Russg <russg@en.com>
Message-ID: <39a5b16b$0$35383$53a6afc1@news.erinet.com>
Source record: 42542

I'm not familiar with Atari Music Composer.
AMS I used to use to make music. It makes AMS music files which
either requires AMS or and AMS player (there are a couple) to play
the music, with a nice little piano keyboard showing lighted up keys
as the tune plays.
The best BASIC music I ever saw were by Jean Rowe. If you wanted
to make a BASIC tune, you might do well to get PINETOP.BAS or
MAPLE.BAS and see how Rowe wrote the programs. You could
probably use her code and modify it to play the tune you want.
Rowe always made a graphic of some sort, then played the tune.

That's probably a 1040 ST. A 16bit computer made by Atari after the
Tramiels (spelling?) took over. It has nothing in common with the 8bit
computers other than the Atari badge.

Archaic interface!? Must every piece of software use a WIMP!? Lynx is beautiful. It just takes time to appreciate.

-snip-

> Ahh, good ol' text. I do remember it. I have never used lynx,
> however.

It's fairly easy to learn. Ten minutes is more than enough time to get a basic understanding of Lynx for the veteran text user.

>>> 2) Does it take forever for pages to load?
>>
>> Much, much, much, much, mucho, faster. Graphics slow everything down >> by an incredible amount.

This is an understatement. If you're using a shell account dial-up feels like broadband.

> Down side is not all web pages are text only friendly.

True. Most are navigatable with recent versions of Lynx though. One of my favorites is when a page will inform me that I'm using an ancient browser and that I'll need to upgrade to use their site. I just smile and proceed to view their crappy page anyways. No adds, no javascript, no superflowous graphics oh my!

> Yes, that is a problem. I am an active eBay user and I am concerned
> that it will not be text friendly. Can anybody let me know?

Ebay works fine with Lynx. If you want to see the pictures just download them to your atari and use a jpeg or gif viewer. The Atari 8bit does have viewers right (I come from the Apple 2 world)?

>>> 3) Are the websites that you visit somewhat limited in content due >>> to heavy graphics usage?

Very rarely. Most sites that use a lot of graphics use it primarily as eye candy. When there's an important graphic it usually labeled or referred to in the text.

>>> 4) Anything else I should know?

Surfing the web is a much less time consuming activity with a shell account's bandwidth and no graphics. If you want to kill time you'll have to look at a lot more content.

>> Just that 2400 baud is probably enough. I type maybe 300 baud and >> read 2400.

2400 baud modems work fine but 9600 is pure heaven. Pages load like lightening.

I've never seen a fax only 14.4 modem. Many 14.4 modems do have fax capability though.

External floppy. 520ST+ = 1Mb RAM. External PSU ;) Atari 520STm - this
model, with the external floppy and PSU, but a TV Modulator for use,
well, on a TV...

>1040ST
> - The 520's big brother; 1 meg of RAM, internal 720k 3.5" drive.

1040STf = Built in floppy...

>520STFM
> - Basically a 1040ST with half the RAM. Some models had 1 meg.
> The main reason for this model was the RF port for connecting to a
> television set (hence the "FM" - fixed modulation)

Atari STFM = Atari Sixteen/Thirtytwo, Floppy, Modulator ;)

>130ST
> - 128k RAM, never released due to insufficient RAM to
> do anything useful.

Insufficient RAM to load the OS ;) The OS on the original 520, 260ST was
loaded from Floppy, with ROM being an 8K bootstrap only. TOS/GEM takes
up 192K...

Richard, picking holes :)

I think I have played it (I've played so many games over the years) :-)

One of my joys is to show a few Atari 8bit games to younger folk who are in
the Dreamcast and PSX ranks, you can almost see the disgust when the
graphics appear.

But you make the same people play the games for a few mins and suddenly
they are hooked.

That's so true. People expect the graphics to look real, but on our old machines, that's pretty hard to do. Gameplay, however, blows the PSX away. I have played only a couple of PSX games I like out of about 80. On my old Atari, I can't stop when I start to count the programs I like. Darn many. Dropzone, Bounty Bob, Rescue on Fractalus, Ballblazer, MULE, Archon, Pac-Man, Pole Position, Elektraglide, Fort Apocalypse (well, here I go again ;-))

Take Atarian care

Yep, I hated the artifacting stuff as it didn't show for the PAL user
correctly, so I used to sit down and alter the display lists if they had
not been done already.

Boring job but so much better looking :-)

Hello everyone!

This is a foreign place to me, as I grew up using a Commodore computer. I have recently begun setting up a BBS that will be running on a Commodore system I recently acquired. But my BBS is going to support a broad range of vintage and classic computer systems. Atari and other classic will have message and file areas.

I would really like to know (for those of you who still enjoy dialing up a bbs) what you would like to see in the way of Atari support on my BBS? I know next to nothing about these machines, and I hope to find a co-sysop who would enjoy running the Atari section of my BBS.

Please copy any replies you make to my e-mail address as I will read them much quicker!

Thanks!
Jeff Hall aka Dr. Video

<sob sob> I suppose you will have to solder on a pin? (don't know...) Wish I could help. It is a good idea (as many of us can testify) to have a few spares or even a unit for parts for when this happens. Of course, you just had the one unit since you happened across it. Best of luck,
Jessica

5346. New Adventure - Scott Adams - Return to Pirate's Island II

Newsgroup: comp.sys.atari.8bit

Hello Guys,

Just to let you know that Scott Adams (of Adventure International fame) has released a new adventure called "Return to Pirate's Island II", and it is for sale at his website at www.msadams.com

Have fun,

Richard.

A files area would be mostly a waste of time, effort, and HDD space
as everything's available via internet.

Your email address doesn't indicate where you're located so it would
be pretty hard for someone to volunteer as your co-sysop.

As to what would be good in a BBS for 8-bit machines:

a. discussion area for 8-bit programmers; much of what is done on
an Apple-8, Atari-8, or C-64/128 is easily ported to the others;

and

b. discussion area for hardware swap and shop as well as notices of
the ilk: "I saw such and such a piece of equipment at this price here".

General info:

1. Most Atari-8 users will connect at 4800 baud unless they're
using an upgrade interface which supports 14k4 (the a-8 serial port max's
out at 19k2 for communications without a complete bypass of the ROM
serial routines). Another reason why a files area would be wasted effort.

2. Try and avoid PETASCII graphics and expect your Atari users to be
polite enough to refrain from ATASCII. (Ah, the good old 8-bit days when
everyone was incompatible with everyone else:)

3. Good luck.

5352. UK 8-bit Computer Museum?

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-25 00:00:00 UTC
From: Brian Watson <brian@spheroid.demon.co.uk>
Message-ID: <967231505.18928.0.nnrp-08.9e98ea3a@news.demon.co.uk>
Source record: 42430
Cross-posted to: alt.c64,comp.sys.amstrad.8bit,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.misc,comp.sys.msx,comp.sys.oric,comp.sys.sinclair,comp.sys.tandy,comp.sys.ti

I'm trying to find a UK museum that includes, or would like to include, some mint condition 1980/1990s 8-bit computers in its display.

There is someone who occasionally posts to the ngs that he is collecting such machines and "hopes to get them on show somewhere" but I now can't locate a posting from him to be able to ask whether the collection has found a display site yet.

The reason I'm interested is that a guy who had a *huge* hoard of 8-bit software has had to send *the lot* for landfill because he couldn't find an economic way of getting it to the right people.

He is now seeking to find a good home (ie, a museum) for the mint condition 8-bit computers he has. He wants them to go on display somewhere appropriate.

He is *not* looking to sell them, so don't bother offering money.

If you can help (and to prevent another round of cross-posting) please either e-mail me at brian@spheroid.demon.co.uk or send follow-ups to comp.sys.misc (follow-ups set).

Also, I will be reading all newsgroups to which it has been posted for at least a week after posting this.

It sort of made you wonder what the techs at Atari were thinking at
the time. :-) Even the 260ST left only 68k of RAM to play with.
Enough to load one desk accessory!

It would be interesting to see that program! :-)

> Well, my idea was this: try to establish the correspondence
> between the A8's hue and luminance values and actual TV hue,
> luminance and saturation values. I mean, hue is expressed in
> degrees, saturation in % and luminance in % or levels...

I thought about that, as well, because the paint programs I have do give the HSL values of colors, along with their RGB values. And it seems reasonable to assume that all 16 luminances of a particular hue on the 8-bit Atari *should* correspond to the same hue on the PC. But when I tried that approach, I found that the 16 luminances of-- for example-- hue 1 did *not* have the same hue on the PC (at least, not in the screen captures that I made). Consequently, I decided that it would be a good idea to create two separate palette files for the Atari800Win emulator. One palette file would give the RGB values closest to the Atari's actual colors (as captured from the Atari's actual video output). The other palette file would give "idealized" RGB values, such that each color of a particular hue on the Atari would share the same hue value on the PC. And there would really be four such palette files-- two for NTSC colors, and two for PAL colors.

The real reason for being interested in the RGB values as opposed to the HSL values is purely practical. The PC colors are defined by their RGB values in the Atari800Win's files. If you're using an official version of Atari800Win, you'll have to change the RGB values in the appropriate file-- which are given as long integers, such as "0x1c1c1c"-- and then recompile the program. If you're using the (in my opinion) improved version from the Polish site I mentioned in another post, you can type the R, G, and B values separately for each color, and you don't have to recompile anything! So even if you want to use idealized HSL values, you'll still need to convert them to the appropriate RGB values.

Thank you for posting these values! :-) I'll check it out!

> Just FYI, I just tried connecting the composite output of the
> A8 to the composite input of my TV tuner card on the PC and grab
> some frames... unfortunately I didn't get "pure" colors, either

It's an unfortunate and unavoidable consequence! :-) I don't think there's such a thing as a "pure" color on a TV; the display seems to be very "noisy" or "snowy," with a lot of tiny variations in the pixel colors, even for seemingly "solid" colors.

Those of us who are interested in these matters might do a "project" where we come up with the RGB/HSL values to use with Atari800Win, both for NTSC and PAL video, as well as for "captured" versus "ideal" colors. Then we could post the results in this newsgroup, both in the format required for the official version (i.e., a "static integer colortable"), and in the format required for the unofficial variation (i.e., a palette file).

I didn't know that didn't work on PAL machines. I always thought it'd
just show up as different colouring. Pity; a few of the coolest games
were done using that technique. (Amaurote, Molecule Man, etc.)

>P.S.: The game and demo guys of the 90`s did the same with many PAL
>programs, they used PAL depending techniques (like overscan routines,
>that merely work on PAL), so these programs cannot run on NTSC machines,
>hehe !!

Ah, yes, but we NTSC-folk could still see the demos by adjusting the
vertical hold (so the screen wouldn't flip when it switched to 50Hz
mode) I do remember seeing the Veronica demo on a real 8-bit though,
and I know some demos did have problems in NTSC. (The amazing Tracker
routine demo for example had sync problems)

Unfortunately I don't know who currently holds the copyrights. All I
remember from the fiasco was that Philip spent a lot of time working
on the updated PC version, only to have to scrap the whole project
when he was denied the rights to publish it. And it was looking so
GOOD, too! The Screenshots at the time were every bit as good as
those seen in Thief: The Dark Project -- very remeniscent of them, in
fact.

1040 = 1040ST. The ST series were the next-generation 16-bit machines
Atari came out with. In fact, they came out with a whole slew. All
Atari STs were a quantum leap over the 8-bits due to having a 16-bit,
8MHz (faster in later models) Morotola 68000 processor, built-in MIDI
ports, expansion/cartrige port, etc. Curiously, the sound chip (a
Yamaha YM-2149) wasn't quite as good as the 8-bit's, having only 3
sound channels. It did do pretty good digital sound, though. STs
also featured more function keys (10), a full-stroke keyboard with
separate numeric keypad, arrow keys, and special function keys like
HELP and UNDO, and looked much like a PC keyboard. There was a whole
breed of Atari computers after the 8-bit. Graphics game in three
flavours: 320x200 in 16 colours (low res), 640x200 in 4 colours, or
640x400 in 2 colours (monochrome, required a mono monitor) Basically,
the ST like looked like the XE's big brother. The short version goes
a little like this:

520ST
- The first real release of the ST. Half a meg of RAM.
1040ST
- The 520's big brother; 1 meg of RAM, internal 720k 3.5" drive.
520STFM
- Basically a 1040ST with half the RAM. Some models had 1 meg.
The main reason for this model was the RF port for connecting to a
television set (hence the "FM" - fixed modulation)
1040STFM
- 1 meg, RF port.
Mega ST-1
- A 1040ST in a retooled desktop-PC-style case, detatchable
keyboard, new TOS OS and Blitter chip for fast graphics handling.
Limited release, replaced by the Mega ST-2.
Mega ST-2
- Like the Mega ST-1 with 2 megs of RAM.
Mega ST-4
- Ditto, 4 megs of RAM (the most a stock ST can have without a new
MMU)

1040STE
- The next gen Atari ST; used SIMM RAM (like PCs) expandable to 4 megs, enhanced colour palette (4096 colours), hardware scrolling, new TOS OS (1.62), stereo sound, and other niceties. An enhanced monitor (the SC-1425 - a 14" model, 2" larger than the ST's SC-1224 and SM-125) was also released to accompany it.
Mega STE
- New off-white desktop case design. Came in 2 or 4 meg flavours. New TOS version (2.0)
TT-030
- The successor to the ST/e line. A true 32-bit 68030 processor running at 16MHz, featuring much higher resolutions, more colours on-screen, an optional Motorola 68881 math coprocessor, and all sorts of other goodies that made this machine a prized posession for the desktop publishing crowd. Never took off for gaming due both to its sticker price, and some incompatibilities in its new TOS version (3.5).
Falcon-030
- The REAL successor to the ST/e line. This beast had it all: Motorola 68030 processor running at 16MHz, Motorola 68001 digital signal processor (DSP -- the same one eventually used in the Atari Jaguar) running at 32Mhz, vastly enhanced graphics chip that was fully programmable to allow the creation of any graphics mode you had RAM enough to display, 65,565 colours on-screen at once out of a palette of 16.7 million, sound was handled by the DSP and the number of channels was limited only by your CPU's power and RAM, a multitasking operating system (dubbed MultiTOS, a.k.a. TOS 4.0) up to 16 megs of RAM, and all sorts of other goodies. I had the chance to spend some quality time with one of these while I was writing for the local Atari magazine, Current Notes, and it was s-w-e-e-t. My only gripe was that they used the old 1040ST case and keyboard, but in its defense, it was dark gray with charcoal gray keys. It was also quite backward-compatible with well-behaved ST apps.

Fringe, odd, and third party models and vapourware:

130ST
- 128k RAM, never released due to insufficient RAM to do anything useful.
260ST
- 256k RAM, short release in Europe before being discontinued for the same reason the 130ST was.
SC-2000 monitor
- A strange little 12" beast with a built-in single-sided 360k floppy drive which saw limited release.
STacy
- A portable (or rather, luggable -- it was heavy!) 1040ST computer. This became a sligtly popular machine for musicians due to the fact that it could easily be taken on the road and used at concerts to control MIDI devices. Madonna used two of these

during her Girlie Show tour. (Or was it the Immaculate tour?) It
was available in 1, 2 and 4 meg varieties.
ST-Book
- A lighter STacy that saw a VERY limited release. This is a rare
beast indeed.
Falcon-040
- A third party upgrade to the Falcon that increased the CPU
to a Motorola 68040 running at 32 or 48MHz.
Pandora
- A third party Falcon-compatible running on a 68060
ABAQ (a.k.a. Atari-Transputer Workstation, or ATW)
- Probably the strangest of the strange in the Atari world
(next to the laughable "Mind-Link" 2600 controller) is
this beast. The ATW was an extensible computer,
which allowed you to run on up to 4 "Farm Cards" --
basically, modular motherboards containing all the
necessary computer circutry. These could be chained
together for multi-processor operation, resulting in
incredibly fast processing power. They ran on a variation
of the Pink OS operating system. Very few of these were
made, and I only ever knew one person who owned one.
On the rarity scale, this would fall into the "Holy Grail"
category. They were not compatible with any existing
Atari platform.
Atari PCs
- Atari also made a range of 8088-based PC compatibles
which flopped big time. These are pretty rare machines,
too -- but they were so bad, they sort of fall into the
"Who Cares?" category.

I know I've forgotten at least one Falcon-compatible whose name
escapes me, and probably a few others, but that's the "short" list of
Atari computers after the 8-bit.

Up for bids on ebay trhrough this weekend.

Click on the links below for a picture and complete descriptions!

MINT! ATARI 800 in perfect condition with 48K+ robotron in box,. chess in box, power supply, basic, cart, joystick and atariwriter cart.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=418397439

RARE ATARI TOUCH TABLET MINTstill in Box
Smells new includes all instructinos and accessories.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=415628394

Absolutely MINT! 800XL computer system with 64K RAM in box with instructions, power supply, RF adapter, and video cable.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=419342048

MINT Atari 400 mint in styro and box, with joystick, power supply, instruction manula ,basic programming book, and and two games in boxes Defender and Centipede.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=415595727

ATARI PILOT COMPLETE PROGRAMMING KIT! !

Mint and complete with large instruction manual ans everything you need!

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=415690290

ATARI 410 Cassette Recorder MINT IN BOX LIKE NEW!!!!

They dont get any getter than this...

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=418341739

ATARI Conversational FRENCH , SPANISH, and GERMAN tape software kits

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=418361904

Atari Computer Eyes Video capture aquistion device mint condition.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=418402477

Super Sketch Tablet mint in Box for use with ATARI includes instructions and is complete in carboard packaging, like new. includes sketch artist cartridge.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=419337643

ATARI 1050 DISK DRIVE in mint condition with ISO cable, Power supply and nice boxed copy of Caverns of Mars on Disk.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=419346219

Thanks for looking and happy ATARI-ING!

Ummmm...you'll have to forgive me when I say that this sounds just a tad implausible. After all, even if he wasn't authorized to use the gaming world, a few simple changes to protect the innocent would have sufficed if Price really had all that great of a game brewing.

I just think it wasn't going to happen. After all, Monolith (which was supposed to publish the game) seemed to drop out fairly quickly.

I liked that one. 'Way out' was another one based on the same maze
type.
Did anyone know, that if you help down the trigger button, you would
move in the direction you pushed the joystick releative to the map.
Made things eaiser. If you backed up into a wall that was behind you
from your viewing angle at the time, you must turn around to see what
is there. The only disadvantge.

I wish I still had my Mega ST4. That was the last Atari machine I
ever owned, even though the keyboard was dying pretty badly.

>out, or was the panther a junior version jaguar (as I had seen
>screenshots of the panther with parts of tempest2000 in development in a
>UK atari mag years ago)

Prior to the Jaguar (ca. 1992 or so), Atari was working on a
next-generation 32-bit gaming console, at the time code-named Panther.
At the same time, a UK-based company known as Flair had been
developing a 64-bit gaming console, but did not have the funds or
resources to market it. They had approached a few large companies to
adopt it and market it, but in the end, Atari was the one that got the
technology, and it eventually became known as the Jaguar (which Atari
later tried to change to Jaguar-64 after Nintendo's announcement of
their 64-bit console. Few people picked up on the "64" appendage,
however) Atari scrapped the Panther project, which was still in the
design stage, in favour of the Jag.

>hardware called CDAR- cant remember the number part, But I definately
>remember seeing it at one of the Atari shows at Ally Pally

Yep. In fact, the CDAR was released in short supply around 1987-88.
I knew only one person who owned one -- he'd picked it up second hand
from a flea market or something. Anyway, it was a plain ol' single
speed CD-ROM drive that read standard ISO-9660 format CD-ROMs. I
don't recall if it was able to play redbook audio, though. In any
event, it was a pretty avant-garde move on Atari's part, since at the
time, CD-ROMs were still a fairly new concept. Unfortunately, it was

too avant-garde, since the sticker price was pretty high, and there were no CD-ROMs for the Atari available. I don't think Atari made any deals with software houses to develop CD-ROM titles for the Atari, either -- hence its inevitable and quick demise.

>Ironic that although Tramiel wasn't interested in taking Atari forward

>were as Inovative and Ahead of the game as ever, no matter how much
>tramiel/gleadow was trying to destroy the company (Warners would have
>been better of selling out to Nintendo or Sony etc...)

It's not that they weren't interested in forwarding Atari in a business sense, it's that Atari just didn't have the wearwithall to properly market their products. After the great video game crash of 1984 and Time-Warner's sale of Atari to Jack Tramiel, Atari's liquid assets weren't worth a whole lot (as compared to pre-crash Atari). Jack had a limited amount of resources to play with, and most of that was sunk into R&D for new products. That didn't leave much for advertising. When Atari re-released the 2600 (renamed Atari 2600 Jr.) I do remember seeing "The Fun is Back" commercials (with that sad little "The 2600 from A-tar-i" rap) and, later, a few commercials for their "Atari Shatters the Myth" campaign to push the ST line. That's the most advertising I'd ever seen them do. After that, I saw a grand total of 1 commercial for the Lynx 2-3 times on TV. (It was actually pretty good, too...) Heck, when Atari released the Jaguar, they allocated US $20 million on advertising. This is peanuts in the cutthroat world of video games; by comparison, Sony and Nintendo were spending hundreds of millions on advertising at the same time, so it's no wonder Atari's commercials were lost in the din. I only ever saw one commerical for the Jag; it was an advertisement for Alien vs. Predator, and I saw it twice.

>And lastly the St certainly wasn't ATARI 8bit's big brother, as there's
>no connection bettween the two apart from the badge
>The only Big Bro's that the ATARI 8bit had, was the thang that became
>the AMIGA, which at the end of the day was a technically better machine
>then the St

True, but I don't really consider it in that light. Amiga (who started out life as 2600 game developers) had first approached Atari to adopt their Amiga computer technology, but Atari (stupidly) turned it down. Then they went to Commodore, and the rest is history. I consider the ST the 8-bit's big brother simply because it was developed and designed by Atari and looked like suped up XE machines. On the other hand, the Commodore wasn't developed by Atari -- it wasn't even developed by Commodore; they just marketed it. It _was_ technologically superior to the ST, though; DMA sound, 4096 colours, multitasking OS -- all stuff the ST should of had from the get go, but didn't.

However, I'd rather use an ST with NeoDesk than an Amiga with Workbench. :-)

Gosh, this lot is at $165.20 right now... kinda scary, like we need to keep our disk collection under lock and key. Basically, it is a lot of 23 Games/Programs for the 8bit computer, some with boxes, etc. Perhaps the fact Ultima II is included (once went up to $100 by itself) may have something to do with the price. Check it out here :)

First I've heard of an 850 running at 9600. I used to use a P:R:C at
9600 but was always told the 850 was limited to 4800. Like everything
else, the only way to really know what you can get out of your hardware
is to keep pushing the limits until it bombs and then back off one
step at a time until it's stable.

You're showing off your youth. My first computer cost me C$1000 back in
'79 and came with 16k RAM, a cassette tape deck and a mono monitor which
was nothing more than a cheap BW TV witout a tuner. Adding a first disk
drive would have run about another $800.

As to the "showing off" bit--if you've got it, flaunt it :)

This thread got me thinking of what I paid for my first Atari setup in 1979.
The prices that stick in my mind (very faintly) are:
800 computer- $800
810 drive- $500
850 interface- $300
Are any of these close?

Atari 850 Interface, fairly common. Use the first serial port out for your
modem (the others have varying lines disabled). The DB15's are for
parallel printers. You need a special printer cable (hack the end off a
PC cable and wire in a DB15) the pinouts are the same as that used by
the MIO but that page is missing in my manual.

I'm unsure as to voltage requirements _I Think_ 9vac same as a 1050.

BTW max com speed is 4800 baud.

Common and nessecary. Allows you to connect several devices to the Atari that you need at the same time (e.g.: Printer, disk drive, modem, etc). I am currently swapping with some of my fellow Atarians so that I can get a working interface, so that I can connect ot bbs' and the like at 9600 baud.

Clu's 850 runs at 9600 baud as well, that's why he is trying ot set me up
with one :).

They were very common when the Atari 400 and 800 were going strong. I still
have mine and it works great. I paid a wopping $500 for it just so I go
play the Seirra Online game "The Wizard and The Princess".

Yo Mindfield, Hows that Atari thang hanging

Anyway re: atari 1040, I never had one but I did have a couple 520stfm's and a 4 meg 520 ste which i still have sitting next to me AMD k62-400 win98 pc (pc's being a heap o' shit anyway)

I remember something about the Atari Panther (the next stage after the vcs/7800), was that the ST games jobbie that Atari were hoping to bring out, or was the panther a junior version jaguar (as I had seen screenshots of the panther with parts of tempest2000 in development in a UK atari mag years ago)

Also whilst we are on the subject, I remember going to Atari shows in Ally Pally (Alexander Palace-ex BBC) early 87 and late 86 and I remember seeing something, which I didint see again untill I received me Best Electronics Catalog from Mr Koda Himself when he was exhibiting at one of the early computer shopper shows (whatever happened to them) as his catalog had a piccy of the said item, namely Atari's proposed CD rom hardware called CDAR- cant remember the number part, But I definately remember seeing it at one of the Atari shows at Ally Pally

Ironic that although Tramiel wasn't interested in taking Atari forward (in a business and commercial sense) At least Atari showed that they were as Inovative and Ahead of the game as ever, no matter how much tramiel/gleadow was trying to destroy the company (Warners would have been better of selling out to Nintendo or Sony etc...)

And lastly the St certainly wasn't ATARI 8bit's big brother, as there's no connection bettween the two apart from the badge
The only Big Bro's that the ATARI 8bit had, was the thang that became the AMIGA, which at the end of the day was a technically better machine then the St

Happy Atari'ng

I have a spare Lynx II for sale. I have the original box, docs and some games. It is in mint condition and works perfectly. I am willing to listen to offers for the next few days so if you are interested in a trade or purchase, please let me know. I am interested in an Atari 7800 w/games; an NEC TurboGrafx-16 w/games or a N64 system. Any trades must be for merchandise in good condition - ie. no nice N64 with broken controller. I have a nice Lynx and want to trade for something of equal quality only. No junk please!

E-mail me direct if interested.

do the famed 4 inch drop , it works for the st and i had something
similer happen to my xe ,(and it worked for me)

if the rom is in a socket ,
over years of playing , the system gets warm and cools warm and cools this
causes some very small expanding and contracting (especially if it is stored in
a shed or attic for years and gets cold in the winter ..)

any way the chip might work it's way a little loose and picking up the system
about 4 inches off the table and then carefully dropping it so it lands on
all 4 feet at the extact same time is usually enough to slam the chips back
into their seats

>legs(pins)...damn...I guess that means that my atari is broken!!! <more
>sob>

you can buy the sockets at just about any electronic store , if you get one
and are very carefull you might be able to put the leg into the socket ,
solder that one leg to the socke and then plug the whole new socket into the
old socket mounted on the board , , if there is enough room for the chip now
that it probably sits 1/4 inch higher then it used to be

I picked up a peripheral box at a thrift store today. It's called Atari 850 and it has 2 IO inputs, 4 serial ports out, 2 parallel outs (look like PC joysticks connectors - not db25) and a power supply input.

I've never heard of it before. How common were these?

Thanks...

Yes, though if you have a high speed internet connection, you might find the download speed suffers waiting for the floppy. It's probably better to download to a hard disk and then transfer the files off line; that way, if you get a bad sector on the floppy, you can swap it and restart.

Good theory. unfortunately, every xegs I have seen has every chip
soldered in.
so dropping it would only crack the case if dropped from a great
enough height :)

First version is the more correct one. I've run into Miner in California and
he used to have a BBS local to the San Francisco Area <San Mateo?>.
> Actually, that Atari lasted as long as it did with the Tramiels at the

> idiots.

IMO: There were several huge mistakes made with their technology and
employees. They basically had bullet proof sound, keyboard, and video
technology in Pokey, Antic, GTIA. As soon as they saw the emerging PC game
market and the success of things like Adlib sound card, they should have
moved into the PC market with their LSI chips and technology. Instead we
have Creative Labs and 3dfx with patch after patch to their drivers and

pretty crappy hardware. I would guess there are some good companies that came out of the lack of an Atari presence: Yamaha used to be known as a motorcycle company, but it seems like more people know them from their sound and video chips now.

But I wouldn't call the Tramiels idiots any more so then Adam Osborne or Eagle Computers or anyone of a 100 other companies that are no more, everyone got trampled in the rush.

But then I believe almost everyone including the successes are no better then average. It just happens that some are luckier then others and happened to blunder into the right market. There are a few geniuses around, it just seems like very few of them are CEOs.

Hmmm. And I heard it was the other way around -- 850s could be reliable up to 9600 (but not with hardware handshaking) but some P: R:s topped out at 4800. There was also some code at one point to allow 850s to do 19.2, but I doubt that many people did it.

I'm not sure if Atari would have fared any better as third party PC
hardware developers. Atari's foray into the PC world with full
systems didn't go very well, even when they had a system that had the
most features and capabilities for its price range in the Atari PC-1.
Of course, they had to compete with grey market, cheaply-made PC
clones, and so brought out the PC-5 as an answer to that, but they
still flopped. I can't really see Atari as an OEM for PC cards being
much more successful. Besides, Atari stopped making their own sound
chips after the 8-bit. (The ST uses the Yamaha YM-2149, which is
essentially Yamaha's version of the AY-3-8912 chip used in the
Sinclair Spectrum 128. The Falcon and Jaguar both use a Motorola
DSP68001 for sound)

> I would guess there are some good companies that
>came out of the lack of an Atari presence: Yamaha used to be known as a
>motorcycle company, but it seems like more people know them from their sound
>and video chips now.

Actually, Yamaha's been around for a very long time making things
other than motorcycles, first making pianos, then moving on to
synthesizers, guitars, amplifiers, and all sorts of other musical
instruments and accessories. The Yamaha DX-7 digital synth came out
in the early 80s, practically taking over where the popular Fairlight,
Emu and Moog analog synths left off. It was one of the first synths
to include a built-in sequencer, which analog synths didn't have at
the time.

>But I wouldn't call the Tramiels idiots any more so then Adam Osborne or
>Eagle Computers or anyone of a 100 other companies that are no more,
>everyone got trampled in the rush.

Oh, I'm not saying they were the worst offenders of mismanagement --
there are countless other flops out there that could be laid squarely
at the feet of their marketers and CEOs, but the Tramiels certainly
made their share, and some were very unfortunate. I do take some
small consolation in the fact that regardless of the Tramiels,
Microsoft would have quashed any competition in the long run anyway,
with its forceful entry into the personal GUI computing foray. They
didn't so much standardize the industry as gave people little other
choice, but they nevertheless made themselves the foremost platform on
the planet, and few companies could stand up to that. Even Apple has
only barely survived.

>But then I believe almost everyone including the successes are no better
>then average. It just happens that some are luckier then others and happened
>to blunder into the right market. There are a few geniuses around, it just
>seems like very few of them are CEOs.

Atari had one major fault, if you could consider it such: They were
too ahead of their time. The release of the CDAR years before CD-ROMs
had become any kind of standard meant death for that machine. The
handheld computing platform was something else again that the world
wasn't quite ready for when they released the Portfolio. Even the
Lynx was a little too ahead of its time. And looking at some of
Atari's concept sketches, we can even see the Atari Databook idea that
looks remarkably like what eventually became the Tandy-Radio Shack
Model 100. But a little additional consolation can probably be gained
from the knowledge that the video game industry isn't the only thing
Atari had a major hand in creating; palmtop computing, colour handheld
gaming, even the popularity of MIDI, can all be attributed to Atari's
forward thinking.

OK, but it would have been a nice guesture for several reasons. For one thing, I still have the IBM PC XT hardware technical reference. They have the mono and color video cards in there and they are just 6845 based.

I figure it would have been an easy port going from 6502 hardware compatible buss to plugging it into an IBM since all the interface with the separate R/W lines was a done deal.

That would be 1/2 the benefit, the other half is people that know how to use things like POKEY could have migrated easier. I am under the impression a lot of people didn't make the transistion to PC well, and this would have helped give people a claim to fame or at least a foot in the door.

But Atari management was never known for being "nice guys" at any stage.
> systems didn't go very well, even when they had a system that had the
> most features and capabilities for its price range in the Atari PC-1.

This was more or less a hardware mistake. I don't think I was the only one who noticed that people didn't really want closed systems by that stage. Kind of reminds me of Henry Ford "You can have any color you want as long as it is black" type of mentality.
> Of course, they had to compete with grey market, cheaply-made PC
> clones, and so brought out the PC-5 as an answer to that, but they
> still flopped.

Right, even if they had it right, they were still a middle man taking a cut for basically doing nothing. Evolution favors the efficient.
> I can't really see Atari as an OEM for PC cards being
> much more successful.

Heck, I would have bought one if the price was right. I still think it would have been neat if they would have done something like a POKEY that did the same work as it did [sound, timers, 4-J/S] in a 5200 and maybe serial port for a mouse or something. Can't remember what I was paying for sound cards back then, but something like $70-$100 would have worked for me.

This may be hard to believe, by my friends that all worked either during the Busnell or Warner days seemed so PO'ed about their management style, it would be hard to believe people actually got more PO'ed at the Tramiels or that they were worse.

Some the people I know said there were so many hard feelings at management that a looting spree went on that could closely be compared to the LA riots. There were even reports of Atari security guards helping people load stuff they were stealing into vans and trucks. You got to be pretty bad when people hate you that much. Kind of like "Et tu Centurians?"

IMO: It was resting on their laurels. It took them from 1979 to 1984 to come out with a computer that was faster then a 1.79 mHz 6502. Ditto for consols, they rode the 2600 longer then they should have.

One of my criteria is "Who is coming out with the hotest upgrades?" In the Atari case where they are selling 100s of millions of computers a year, a lot of the inovation was outside of the company. Gadgets by Small, different accelerators, that kind of stuff. Atari rode the 8 mHz 68000 to long, I saw dozens of people leaving our user group as IBM style boxes left them behind.

Apple didn't survive, just its name. The company marketing the candy
colored garbage is Next in Apple's clothing. Steve Job's reality
distortion field is more powerful than it's credited with being.

Yo! Mindfield, Still Hacking away on the ol' Atari, keep 'em humming, thats what I say

Anyway re:atari 1040, and more specifically the Amiga issue

Firstly the Original Amiga company was financed/Funded by Atari, founded by ex Atari 8bit and vcs hardware engineers, namely Decuir, Miner, RJ Mical (Lynx), Morse and Neubauer (star raiders/pokey et al) and lastly Steve Meyer or Mayer (good buddy of NB),and if you visit the Atari historical soc. internet site, you'll see that Atari already had there mits on the Amiga h/w, long before the tramiels F@*!ked things up, as they had exclusive rights to producing Atari 8 versions of what became the Amiga h/w, I believe the a7800 h/w was destined to go the same way, ie as new h/w chip set for the A8

Also re the CDAR, why is it that you americans always seem to be able to purchase the sort of Atari kit that us Europeans can only dream about

I suppose that the CDAR is now about as collectable as KC muchkin, an Original (not hacked/pirated) copy of the unreleased Behind jaggi lines/last star fighter, The 65xeme (or Xeem), XEportable, the 1200 (pal) or anything like the 1400/1450 series... Or am I just jealous of you Yanks

Also, while wer'e on the subject, I'm suprised that you, an american stuck up for the tramiels in the fashion that you did in your last posting

I say that because even Sam T. himself admitted in an interview to Next generation mag (the US version of UK's Edge mag.) accepted that Time Warner/Warner Communications had been an Investment Partner in Atari since Warners Sell out in 84

And looking at it logically since warners still owned a quarter of Atari corp untill Tramiels reverse merger with JTS, their was nothing to stop Atari asking Warners to contribute to the Advertising/Marketing for Atari, since Warners still owmed part of the company and the technology, it would have being in their interest to

Warners were good at selling Atari, in the numbers they did, which is ironic since the mgmt at the time had no product knowledge, and didn't understand fully the technology they were selling

The tramiels on the other hand had the product and technical knowledge and skills that could blow anyone away, but severly lacked the neccessary spunk when it came to selling and marketing

if anyone in 20 years time was to write a brief synopsis, of Atari history from Warners upto JTS , they I guess would arrive at the same conclusion as I have, namely Atari suffered because of it's management, and not inspite of it... Essentially Atari invested in the wrong type of management... unless you'd beg to differ

End of pitch

>ie as new h/w chip set for the A8

Well, The History of the Personal Microcomputer, Home Game Console and
Arcade Machine page (http://home.tampabay.rr.com/jguru/history.html)
told a rather different story:

"Also in 1984, a company started by some doctors from Florida was
looking for someone who would take care of their baby, the Amiga
Lorraine. They offered the Amiga to Jack Tramiel of Atari, but when
they found out that Jack is only interested in the Amiga's technology
and not the unit as a whole, the doctors decide to sell the Amiga
concept to Commodore instead, thus changing the Amiga Lorraine into
the Commodore Amiga."

>Also re the CDAR, why is it that you americans always seem to be able to
>purchase the sort of Atari kit that us Europeans can only dream about
>
>I suppose that the CDAR is now about as collectable as KC muchkin, an

>(pal) or anything like the 1400/1450 series... Or am I just jealous of
>you Yanks

LOL. Actually, I'm a Canadian, if that makes any difference.
Nevertheless, it certainly is a collectable. They didn't make very
many of them before pulling the plug. I'd imagine that if you can
find one at all, you'd be very lucky to do so, as they're probably
worth a handsome sum to an Atari collector. The proposed 65XE models
you refer to are the 65XEM and the 65XEP. The XEM was basically a
stock 65XE that was to have the "AMY" synthesizer chip, while the
65XEP was supposed to be a portable system with a built-in 5" green
monochrome monitor. Neither model ever came to light with the

exception of prototypes being displayed at the 1985 Consumer
Electronics Show.

>Also, while wer'e on the subject, I'm suprised that you, an american
>stuck up for the tramiels in the fashion that you did in your last
>posting

Oh, don't mistake my excuses for sticking up for them; the Tramiels
bumbled Atari straight to the grave, there's no doubt about it. But
the blame is not _entirely_ theirs. Atari never enjoyed the liquidity
that they had once enjoyed during the 2600's heyday, and large scale
commercial advertising campaigns were quite beyond their capabilities.
All they could muster were small campaigns that generally never lasted
very long, and only tended to cover major networks. I'm sure they
could have afforded to put a _little_ more into those campaigns --
either to increase their longevity or widen their coverage --
especially in light of the many failed projects that came out of their
R&D department. But unfortunately there was a lot of waste in that
area -- from the 65XEM/XEP models, the laughable 130ST and 260ST
attempts, the never-released 8-bit Atari monitor (XC1411), the 3.5"
8-bit drive (XF351), the 1400XL/XLD models, and many other
flops/vapourware. This costed them lots of money and in the end was a
small part of what helped to contribute to their untimely demise.

>I say that because even Sam T. himself admitted in an interview to Next

>
>Warners were good at selling Atari, in the numbers they did, which is
>ironic since the mgmt at the time had no product knowledge, and didn't
>understand fully the technology they were selling

While it's true that the Tramiels probably could have looked to
Warner, it seems rather unlikely that Warner would have invested that
much into it. Warner knew Atari was a sinking ship during the crash
of '84, which is why they dumped all but 25% of it. Atari recovered
only marginally from that crash, staying alive, and certainly still
having the brilliant engineers that they always had, being the first
to come out with a lot of things the world now takes for granted
(palm-sized PCs, handheld portable game systems, standard MIDI ports
-- which still don't come standard with any home computer -- not to
mention patents innumerable that's still used in modern systems and
games) but they just didn't have the ability to survive in the long
run because they just didn't have the money to really push the

technology.

It's an unfortunate truism that the innovators are rarely the ones
that enjoy the success of their labours.

>The tramiels on the other hand had the product and technical knowledge
>and skills that could blow anyone away, but severly lacked the
>neccessary spunk when it came to selling and marketing

Quite true. The Tramiels never had balls. They were pretty good at
suing -- and winning -- on the basis of patent infringements, though.
:-) Hell, if it wasn't for the Sega suit in 1994, Atari probably
wouldn't have even gotten as far as they did with the Jaguar. The
settlement of that case gave them their advertising money with about
$30 million to spare to make more units.

>if anyone in 20 years time was to write a brief synopsis, of Atari

>conclusion as I have, namely Atari suffered because of it's management,
>and not inspite of it... Essentially Atari invested in the wrong type of
>management... unless you'd beg to differ

Actually, that Atari lasted as long as it did with the Tramiels at the
helm is a wonder in itself. I think the most serious move was Jack
handing the company over to his three sons. Jack himself made
mistakes, but he was a much better CEO than his sons, and had plenty
of experience at it with CBM. His sons on the other hand were just
idiots.

They sound about right :). Interface would have been about $500 though. Today,
you can put all that together for a PC with 4 Gigs of memory and an unsatble OS.

No, I'm not :) Well...just a little bit but I do remember when an Apple IIgs would run around $1000-$1500, base unit. Now I get pissy if I have to dish out more than $20 for anything for my PC.

> My first computer cost me C$1000 back in

And that whole set would be about $20 US$ at goodwill :). Worth every bit at the time.

5406. Atari 8bit Chat this Tuesday Evening, on Games

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-28 00:00:00 UTC
From: DCM01@USA.NET
Message-ID: <39aa28f8.1299958@news.CIS.DFN.DE>
Source record: 42380

This announces our weekly IRC chat for Atari 8bit enthusiasts. It's scheduled for August 29th, 2000, 10:30 pm Eastern US time.

Here are the corresponding times for some other places, choose the one near you.

California: 7:30 pm. Colorado 8:30 pm. Texas 9:30 pm. London, England: 4:30 AM. Berlin: 5:30 AM. Hong Kong: 11:30 AM.

The topic for the chat will be "Games and Game Programming."

General Atari8 chat is also welcome. If 7 people show up, I will provide a doorprize. The doorprize is a like new copy of Preppie II by Russ Wetmore.

This will be a standard IRC chat. It is not a web-based chat on your browser. You need an IRC client, such as mIRC. The chat will be on Amiganet. Here are some servers that will get you there:

irc.whiterose.net
thule.no.amiganet.org
linux.us.amiganet.org
au, uk, se, no & us.amiganet.org

Once you log onto a server type "/join #atari8" and we will be there waiting for you I hope!

5407. Anyone Remember this Game: Outpost?

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-28 00:00:00 UTC
From: DCM01@USA.NET
Message-ID: <39aa2a81.1693911@news.CIS.DFN.DE>
Source record: 42381

Outpost was published in Compute! I believe. It was a game where you portrayed the operator of an outpost in deep space. You would have to fight off attacking enemy ships using phasers or torpedoes. The game was strategic and turn-based. It made an interesting use of player missile graphics on a GR. 0 screen.

Has anyone got this one still?

VS

5408. Welcome to comp.sys.atari.8bit!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

5409. Epyx: 7800 Games?

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-28 00:00:00 UTC
From: Manuel Polik <Manuel.Polik@Tenovis.com>
Message-ID: <39AA71C6.17FAC04F@tenovis.com>
Source record: 42383

Hi!

For my website project called 'The Epyx Webshrine' I'm currently researching about Atari 7800 games. As far as I know there should exist Impossible Mission, Summer Games & Winter Games.

- can someone confirm if these really were officially sold?
- and if 'yes': Can they be found on the net?

Hope someone can help me, TIA.

Manuel
(BTW: The site is not yet online, if you show interest in it, I can post the link asap - when it's done.)

Message-ID: <8oe2j5epc1@nnrp1.deja.com>
Source record: 42385

Yo! mindfield, how's the Atari thang going, keep those Atari's humming, that's what I say

Firstly, sorry for calling you an American, however in saying that i was being very general, and relating to anything and everything eminating from the north and continental American markets, which correct me if I'm wrong encompasses Canada does it not.. And ofcourse since Canada and the US were once part of the British Empire... Well we won't go into that.. I could be very insulting and refer to Canada as the 53rd state of the US, or even more cutting, that Canadians are the closest living relatives to the Americans... Oops! lets not get too bitchy

Anyway, I though that the concept of the internet was to break down those nationalistic barriers, and here you are doing your level best to put them up again....

Anyway back to reality, the only reason why Atari failed in the long run is simply because Atari's management didnt understand the concept of investing and advancing the technology that Atari was founded on, if it did, companies like MS, Intel, Sega, Sony etc... Wouldn't have stood a chance.. That's why machines like the Lynx, The St book, The Midi concept, Porfolio, Cdar, Jaguar etc.etc were too avante garde (to use your phraseology) or too next gen.. to be considered current

If Atari had been on the ball, It would have taken a leaf out of IBM's book, in that IBM's PC only became successfull, not because it was IBM or because of the Technology, it's simply because IBM did something that no other company has done since, and that is to licence out the technology to 3rd parties (ie.. dell, compaq, hp, mesh, tiny, etc etc)

If Atari had gone the IBM route, Atari woyuld have been a stronger competitor to the PC then Apple was, and if Commodore hadn't the problems it had in the early 90's The Amiga would have taken the lions share of the Video and graphics market from Apple, since more people and companies were using Amiga then Mac's

What Atari should have done was to have licenced out the A800 in '82, the ST/e about 87/88, the falcon at about 90/91, and also licence out the Jag/Lynx tech.. shortly after release, That way Atari would have stemmed to flow from Atari to PC/Mac, Microsoft wouldn't be anywhere as big as they are now, And Atari would have being the standard PC config..

Still, we can only dream... Although, as much as though I would like to see Atariu succeed under Hasbro Int. I fear that unless Hasbro start getting Atari back into H/w with cutting edge tech.. , I cant see Atari

surviving in the long term as a software company... After all what's Atari going to release after it has gone thru it's archive of golden oldies, will it start releasing Classic Commodore stuff, Sinclair spectrum, Sega megadrive where will it end

Secondly how can they expect that to compete with the current established standards, ie Quake, TR4, Half life etc... Me thinks you get my drift... Because it doesnt't matter what generation you come from, albeit 60's, 70's, 80's or 90's those in the know won't be able to relate to Atari as a software company... Andf that's a proven fact....
Why doesn't someone tell Hasbro to wake up and smell the coffee, or is hasbro interactive run by Sega/Nintendo lovers

Think about it, Atari's name selling on a competing system, It's a bity like asking microsoft to start marketing Linux or DRI's GEM/Tos, or IBM to start marketing Cray's or Compaq's... It's unthinkable, so why are we letting it happen to an Institution like Atari, A organisation I trust we still care deeply about

Yours Atarilly

hi Ron,
wow, the 74ls244 is a standard type ls ttl and can be replaced by
any 74ls244, it is most likly the buffer/driver for the printer port
itself. the other one is weird sounding, my 1150 uses a 8051 cpu that
interfaces with the SIO port on the atari. maybe you can carefully
peel any stickers off the chip and get to a real part #.

Ken

If you mean "convert .ATR into a real 8-bit floppy", then the answer is no;
otherwise a floppy is just the same as any other permanent storage except for
speed and capacity.

-Ron

I don't have a solution but I admire the problem.

Those were them.... NO stickers; just bare black chips printed in that really faint silver paint. Had to get them in some good strong light to read them accurately.

-Ron

I don't have a solution but I admire the problem.

You can only do this with a real Atari disk drive and the SIO2PC cable.
Never tried it myself but I hear it works great!

I have all the old Atari Compute magazines and their disks. I believe there
were about 5-10 of them before they stopped.

Hi,

Does B & C have a web sight? If so, what is their URL? I would be
interested in such a device.
I have a Samsun 15" SVGA model Syncmaster 550s

Thanks,
g'day

From: rhamiiton5@aol.comedy.com
Message-ID: <20000827232926.12981.00000040@ng-cp1.aol.com>
Source record: 42377

I opened up the printer interface; it contains two (2) chips (both soldered - no sockets). One is a 28 pin probably propriety chip marked:
AMI 8515 MAK
MPP MPRINT
PHILIPPINES

The other is a 20 pin marked:
P8552
DM 74LS244N

mouser.com lists only a 74LS244D in their online catalog.

Two questions:
1) Which chip was likely blown during a hot swap (disconnect - reconnect with the 800 powered on)?

2) If it is the 74LS244; is the "D" model a suitable replacement for the "N" which came from the factory?

TIA

-Ron

I don't have a solution but I admire the problem.

It wasn't dead until they crossposted some advert/referral/other crap to various groups, and people with more speed and ability had the page removed and presumably, the account cancelled.

Richard, from alt.gothic where we post SPAMmer's heads on sticks at the door.

The BASIC is enabled. Turn Power off and hold OPTION key while turning on
again. Wait until it starts to load to release it.

Press and hold option while turning on the system. This will disable the
BASIC ROM which will look like a cart to most programs. Occupies the same
memory space...

The 850 would allow you to connect the printer to the serial port. You might find the 850 at flee markets, maybe.
There's also an advanced version of the 850 called the 850 XL which was sold by a third party manufacturer here in germany. Should be a bit harder to find it, but it also allows printing of graphics characters (which are printed in terms of Epson compatible graphics, of course).

In case you're familiar with "do it yourself electronics", I've here the schematics of a parallel printer interface that plugs into the expansion port of the 800XL. Requires special software to use it, though, as the Os printer driver can't make much sense of it. Whether this unit would work with the possibly different 65XEGS I don't know. The unit is basically a VIA port chip plus two TTL drivers for the printer, nothing more.

So long,
Thomas

> I could not get the Chroma option to work. The screeen would come on and
then go off <
I have a JAM!! composite -> VGA convertor.
I use the S-Video input, which produces a clearer picture, but Chroma works
with either the S-Video or Composite input lines. The Chroma only produces
only a fair picture, with many fine vertical lines visible on the screen. When
I added the "Super VIdeo" upgrade, the Jam would no longer work -- had to tear
most of it back out. When I tried the XEP 80 which is Chroma only, it would
not work at all. Makes me think these devices are pretty touchy about the
signal that they use.

Larry,

Thats nothing, I heard an Apple 1 went for $40,000 last year, now thats impressive. 10 years ago you could've bought a 1450XLD for $150, so its certainly a valued investment for someone who's not a collector and just wants to make a few bucks I guess.

Your sequence of events is slightly off here. Flair was working on a
16-bit project when they got Atari's attention. Atari approached them
about doing something more advanced. Eventually Flair II was formed,
with Atari as a partner and financial backer. This group developed the
Panther and Jaguar at the same time, with the Jaguar intended to be a
future successor to the Panther. Well work on the Jag progressed much
better than expected, so they dropped the Panther and dedicated
themselves to bringing the Jaguar to market.

Well, they were working on a fancy sound chip for the ST series (and the XEM, which was never released) called the AMY. They eventually gave up on the chip and went with the Yamaha chip and MIDI ports instead because they had so much trouble with it.

As for the Jaguar, it had a custom designed DSP (on the Jerry chip), not a Motorola DSP.

>> I paid a wopping $500 for it just so I go
play the Seirra Online game "The Wizard and The Princess". <<

Ok, I'll admit this is fairly trivial, but I don't remember the 850 interface
ever going for anything like $500, at least from 1982 on, and in the U.S.
(Perhaps this was the 810 floppy drive price?) Out of curiousity, I dug out
my receipts for my early A8 purchases:

Atari 800 w/16K, and 410 recorder $899
(Computer Works, April, 1982)
810 floppy drive $429
(Software Street, July, 1982)
850 interface $159
(Software Street, July, 1982
As best I recall, the "list" price for the 850 was $175 at that time. I have
just about every computer receipt I ever got -- but I don't have the nerve to
add them up!

What would you consider, since the Atari 800, to have been ahead of it's time? Atari /was/ the 8-bit range, really - that system showed true advances for everyone, and did people need convincing? No. Any advance in computers at that time was eagerly snapped up, the marketplace shows the moderate successes achieved by hundreds of start-ups and Oriental efforts. They didn't die because they suffered from poor sales, but more, because they lacked ongoing sales.

Had Atari sold 400,000 of the 400/800 range in the first two years, then none at all, it would have died - but still have been successful.

People /wanted/ 16-bit computers. The market was also undergoing a shakedown period, and Atari was in a good position from the public perception - it had been around since 1972.

>This can take quite some
>time. Look at the CD-ROM. Philips came out with it in 1984. It took
>a good 6 years before it became popular enough to be considered any
>kind of standard.

That's a poor example, though, because in 1984, what the hell could you do with 650Mb of 'fixed' storage from a consumer point of view? Movies? There wasn't a processor affordable enough to handle decompression and provide an acceptable level of playback. There still isn't, because 650Mb is either too much for text, or far too little for graphics.

For Audio - it's perfect :) (it's also become a good way of shipping bloatware like Office 2000, which does in 4 CD's what AppleWorks GS did in around 1.5Mb ;) AppleWorks GS also mixed vector and bitmap objects).

>Video games were considered a passing fad for
>years.

The problem with video games, was that they cross two boundaries. In the 80s, people didn't know /what/ they wanted - did they want cutting edge technology? Or was a good software base more important. Look at the ongoing sales of the NES and Master system into the early 90s - by which time their graphic capabilities were appalling - simply because they were low cost.

In 1992, you could still buy a 7800 in Toys 'R' Us in Edinburgh. Some games, frighteningly, are dated 1990. Atari missed the point there not because the 7800 was dated (on paper, it kicks NES ass, so to speak), but because the concept behind it was dated - the NES was like a VCR, you couldn't mess it up, it looked tidy, it looked /tough/.

It was cheap enough that you would buy it for a 5 year old. This is the kind of concept that Atari had worked for with the 400 - splash-proof keyboard, rock-solid build, simple to plug in, and cleverly, it switched off when you opened the door to plug in a cartridge. They lost the plot, couldn't identify a sensible market, and by 1985, were really going to have trouble.

Commodore also had reached make-or-break point by 1985. The C64 survived only because of aggressive marketing and cheap games (at least in the UK, where people still considered a disk-drive to be an expensive add-on). Atari's UK presence was almost nonexistant, because the XL range had few games, truly sucks without a 1050, and was horribly, scarily expensive. They hardly even tried to sell the XE here, when Commodore was still promoting the C64 with film tie-ins. Sure, they were dire, but consumers are unsophisticated.

>Nevertheless, my meandering point is that Atari didn't have the
>patience or the long term strategy to release something, then back it
>up with lots of support.

Atari were born of innovation. I think that philosophy stayed with them. They felt they had to be first, had to be ground breaking.

Take IBM, Apple, and Atari. Apple came last, and Jobs, being a smart cookie, mixed the two approaches. IBM is stable, but changes slowly. Atari makes technology for the sake of tech - a lot of their patents had no real-world application back then. Apple mixed the stability of IBM with the innovation of Atari (and got soundly slapped when they hadn't paid attention, hence Macs always having a crippled sound system).

>Moreover, their reputation of vapourware had
>jaded the general public's confidence in Atari's ability to carry out
>any promises of support.

Not in 1985, it hadn't. Atari had been a solid firm, apart from changes in ownership. But that is when the rot truly set in.

>The Lynx barely had 100 games released for
>it.

The Lynx had serious competition in the form of the Gameboy - and we return to the point about technology above - Nintendo understood that the real benefits would be the ability to play anywhere, anytime, and to have an enjoyable game - and for the product to withstand being dropped. I've dropped an original Gameboy when running, and it was unmarked. The idea of dropping a Lynx doesn't bear thinking about - I'd still be looking for parts a week later.

>The Jaguar had about half that, including JagCD games.

In the UK, the Toilet never really got released at all.

>They just
>didn't hook enough developer interest to keep either platform going,

Developer interest costs money. This is where Atari really had a problem - when the Jaguar was released, they were trying to manage the ST line, the ATW project (which frankly, was a waste of resources intended to show people that Atari were a serious computer company - for reasons which become clear if you look at the ST line objectively), and Lynx - which took a lot of resources.

>and that in turn didn't hook enough public interest to sell either
>platform in sufficient numbers -- though the Lynx outsold the Jag by a
>fair number, probably because it was the first colour portable game
>system. (The Jag was also the first 64-bit console, but the debate
>over whether or not it was truly 64-bits kept RGVA hopping for months,
>and to be quite honest, there were VERY few games that truly exploited
>the power the Jag was capable of)

The Jaguar never looked like it belonged. It's a strange product - the games weren't cutting edge, even though the hardware was - and in 1994, a real threat was looming over the horizon in the form of 3DO (and presumably for those in the know, PSX). The technology led gamers, which were a growing force having been tempted by Neo Geo, PC Engine and other Japanese platforms, wanted a home-grown product, and 3DO was it.

>I dunno about that. IBM and Apple both fought tooth and nail against
>clone manufacturers at the outset.

Apple won. Eventually.

>Plus, the PC's popularity wasn't due simply to the abundance of clone
>manufacturers. That little Washington-based company known
>affectionately as Micros~1 had a great deal to do with the burgeoning
>popularity of the platform by providing a popular GUI that, probably
>for the first time, made the PC a heck of a lot easier to use than
>plugging away at a DOS prompt.

Argh. Not really. Again, Atari's rot set in around 1985. Windows V1.0 stank compared to GEM, Macintosh System, and probably a million other alternatives. Lets say at this stage, there are PCs being installed - a lot of companies had been using Apple][s, a few had been using Ataris or CBM business-line machines. Both of the 8-bit companies (Apple had Mac and Lisa already) dropped the ball right here, because the engineers stood back and said 'now what'. The CP/M market also stood back, and looked with them at their formerly huge Z80 powered market collapsing.

What did they do? Nothing. CPM/86 couldn't compete with DOS (though it found a new hiding place, as CPM/68, on the Motorola powered machines, and it lurks under TOS today).

Atari could have had that market share, but they released a machine that looked like a toy. Except, as a toy, the headline specifications were dreadful. Remember - the consumers, on the whole, don't know or care about the Amiga debacle, all they see is Atari, once leaders in their field, releasing a hastily thrown together combination of off the shelf parts - and being laughed at in the press, too. 'Jackintosh', anyone? Apple had beat them to it.

>Of course, the fact that Microsoft had a habit of buying their
>competition and any other company that could benefit their growth
>outright also had a lot to do with it, too...

Microsoft really started doing this after Windows had gained a lot of momentum. In 1985, Apple could have bought Microsoft. So could Atari. Perhaps not Bill Gates, but they could have bought the software.

>Oh, and Microsoft would have been as big as they are now. If Atari
>had become as serious a contender as your depiction makes them,
>Microsoft would just have bought them. :-)

But Atari were a hardware brand - they never innovated in OS technology and the concept of /marketing/ an OS hadn't worked before then. CP/M wasn't 'marketed', it was there, in the spec sheets. Microsoft wouldn't have cared, and if Atari /had/ been winning, Microsoft would simply have produced software for Atari. MS always backs the winning horse, and then messes the odds up later. In the early days of Macintosh, because MS could see the potential, Excel (the killer app - the Spreadsheet) was on Mac first. Some people have even suggested that Windows was developed as a mechanism to get Excel onto the PC in a familiar form.

>Actually, it's quite thinkable. Atari developed software for other
>platforms. Any time you see an Atarisoft or Tengen title, you're
>seeing an Atari title. Atarisoft released a number of games on the
>Sinclair Spectrum and Commodore 64. (Ms. Pac Man springs readily to
>mind) Tengen typically released Atari Games arcade ports such as Hard
>Drivin', S.T.U.N. Runner, etc.

I don't think this really counts, though. These are games, not OS'. Hundreds of software companies released games across platforms.

>Oh, and for a bit of trivia, DRI developed a version of GEM for the PC
>many years ago. (Don't ask me for it; I havn't been able to find hide
>nor hair of it...)

It was very heavily marketed on Amstrad products in the UK - and FWIW, GEM was already in development before the ST. You won't find it, since Apple sued them out of existence for marketing it as an OS for IBM clone machines - Scully didn't view Atari as a threat, except in the music market where Apple couldn't market themselves thanks to George, Paul and Ringo. Perhaps Apple left Atari alone to keep MS and the IBM clones out of the music market.

>In all likelihood, it wouldn't have any of Atari's
>hallmarks -- slick design, forward thinking, features as standard that

>no one expects as standard, all at an affordable price. No, if they
>released any hardware with the familiar Fuji sticker, it'd still be
>Hasbro-made as far as I'm concerned.

I think you're wrong, because Hasbro has shown great market awareness here. Any one of us could design a computer with the Atari hallmarks that we perceive - for me, it would be a strong, solid computer with simple but well written games. What it would really have to be, though, would be a marketing exercise based on a PC - perhaps with a bundle of Atari games. There's no place for technical innovation from computer companies, even Apple have decided the best place for them to innovate is in making computers that look like they belong on the set of A Clockwork Orange. If I had to reinvent the ST, I know exactly what I would have changed, but there's no place for that machine now.

Atari 2000 product line?

How about a PC-based machine like the above, a tough, light grey laptop with MIDI ports built in and the OS in ROM (no. Scratch that. No-one /really/ cares about MIDI for live performances anymore, it's all sampled).

Atari messed up. The Tramiels messed up because they were greedy and arrogant, they thought they could take on Apple (who had been developing the Mac for 5 years) in 18 months, and also out-Amiga the Amiga specs that they were presented with. After all, the original Amiga stuff looked like the 8-bit projects that they were working on.

They bought in software for the OS, just like they did with the 400 range, and missed completely why Apple's GUI was so nice, why five years of research was needed (Susan Kare - thankyou for the round corners on the folders). From a consumer point of view, the ST looks like someone described a Macintosh front end, and someone else - an engineer - drew it.

It's not Atari's fault - it's DRI's fault. You can't use the excuse that MS had to make for Windows 3 being so damned odd, that they were working around lawsuits, because at that point, Jobs was too in love with his hardware to even think about the possibilities of the software.

I'm not knocking Atari - I love the 8-bit range, and like my STE because the music software is cheap and simple - but I /always/ considered the ST range to be incredibly badly conceived, with fixed resolutions dependent on monitor and no real upgrade path - Apple at least were consistent, saying that a pixel was a certain size and stayed that way, until the availability of multisync displays let them maximise their VRAM and compete with that aspect of the PC.

Think of Atari's last 'consoles' not as Atari products, but more as third-party devices which Atari provided funding for (I'd hesitate to say 'and market experience', as the Tramiels had /no/ experience of that market and proved consistently that they failed to understand it at all) and it makes more sense.

Once upon a time <39AC7E2C.1B3A7A02@earthlink.net>, Jessica C <beadsandb
angles@earthlink.net> grabbed chalk and scrawled:
>Hello Atarians, hackers, jybolac-ers.
>
>I have a few questions that are going to require a little knowledge in
>Atari history, in particular the XL series.
>
>1- 1400XL computer. 64K ram, 24K rom, 6520C processor, built in 1030
>modem. Speech synthesizer. Why is this unit included in a "catalog" of
>the XL systems but is not readily available? The unit was supposed to
>be out by September of 1983, why did it not come out? Not profitable
>enough? Or was the unit released to low demand?

There are a few of the 1400XL in existence. I think it co-incided with a
fairly bad period for Atari, there is little mention of 'trouble'
regarding production.

Perhaps the fact that Commodore didn't release a C64-modem machine made
Atari think twice. 1983 was when the first price reductions came about.

>2- 1450XLD. Sounds ingenious for the time, looks almost like some of
>its predecesors like Apple II with the built in drive, modem, synth,
>etc. 24K rom. I have seen the unit up on eBay for $1200 but what I am
>really wanting to know is why the unit was not released. Ahead of its
>time, in true ATARI fashion but never releasd, huh? Supposodly to hit
>the market in October 1983.

The 1450XLD would have cost far too much to produce, and there were
problems with the drive controller. It would have been aimed at the
business market, but that market was more focused on CP/M (see: Atari
1090 expansion box and Z80 processor - Apple had been shipping these
since 1978, with the most popular 'softcard' being a product from a
small company called Microsoft). It wasn't really ahead of it's time,
when released it would have appeared bulky and not so much over
specified, but 'wrongly' specified, for the market.

Look as CBM's rival products, which also failed to surface in any great
numbers - the P-series. They made two variations of spec, with graphics
like a C64 and joystick ports, or 80 column like a SuperPET.

Historically, when 8-bit engineers decide to make a business machine
which didn't 'turn out that way', it fails. Look at the Apple /// - that
machine has killer graphics for 1981, but most people don't know because
there's no software to take advantage of it, and they all shipped with
greenscreens. Since most games ran in Apple][mode, they thought the
/// was a][with more RAM, a better 'soft' OS, and a built in 80-column

card.

Even if it had been commercially released, the 1450XLD would have
failed. I'm not sure that the 1400XL would have.

Right, but compiled file must be named AUTORUN.CTB. (for this one file
Runtime searching at the first)
What to do if you have more *.CTB files on disk and don't want to run
from Runtime menu ?????
Or simply want to have one runable file only ???

I think it can't be so difficult. Just find some way to put together
CTB file and Runtime program without of Runtime searching for
Autorun.CTB and will go to run address directly...

I believe there are such program,,,, but where to find ?????

D.

Yep. They're damned, but they're still the world's largest software
company. Blame capitalism. :-)

>Centipede for the Coleco Vision console comes to mind, as well as Ms. PacMan
>and Pole Position.

True. AtariSoft came out with a number of arcade ports for various
systems. Tengen did Atari Games' ports. Curiously, S.T.U.N. runner
still bore the Tengen name even on Atari's own ST line...

>Ain't nothing like the real thing... Think of it, our machines are dawning

I think Bill Wilkinson gave some numbers at one time, could of been someone
else but I think it was him.

Ever see those reports of the military spending ~$600 for a hammer? In 1983
cost controls were so out of hand at Atari that they couldn't compete in the
market place. IIRC: Things like the 1450XL were supposed to sell >$1,000
into a market where you could get a C64 with printer and monitor or C128 or
Apple IIC for less. The Ataris were still 40 column ANTIC/GTIA, so they
still were not suitable for office use.

I've been in the same situation but with a different company then Atari.
Nothing like corporate VPs hiring bimbos/executive assistants at 3 times
what you are making, then making you subordinate to them and sticking their
overhead onto your development programs. Some of the pre Tramiel Atari's
abuses were so grievous that 20 years later people are still "major PO'ed"
kind of thing. I think John Ritter even did a take off comedy routine using
the Sally Struthers "Feed the children" type pitch except in his comedy
routine he talked about poor Atari excecutives that couldn't even pay for
their racketball lessons. It was that bad and that well known.

You have to know the background of the movie industry <Warner> and their
abuses. For instance, the author of the book "Forest Gump" was paid

~"$100,000 for the movie rights + a percentage of the gross profits". After the movie had grossed something like $1 billion dollars through distribution and tapes and whatnot, he still had not seen a royalty check as it hadn't turned a profit. That was Paramount BTW, they are still around and as successful as ever, but I think they were absorbed by Viacom.

The movie industry do things like bill themselves $600 for crate used as a prop in a movie to move profits around. Now you have that metality going against people like Bill Gates, Steve Jobs, the Tramiels, DRI, Borland, IBM, ... Kind of like sending Golden Girls against the WWF. Begs the question, "WTF were they thinking?"

I worked for Atari at ECTS the 2nd year Sony attended. The ATari stand was
next to it. I stood there surrounded by Attack of the Mutant Penguins and
that crappy Dinosaur fighting game on JagCD and looked over at Wipeout on
the Sony stand and realised there and then Aari were going down. I'm
surprised they lasted as long as they did after that.

>No-one /really/ cares about MIDI for live performances anymore, it's all

Yeah but you need MIDI to trigger the samples unless it's all on a DAT
backing track.

That's cause it was! The Amiga was basically a 16bit 800. Same chip
designer, after all.

Iain

Well,
Gary Gilbertson used a sort of assembler editor to create his AMP tunes
(thus GG-AMP tunes are obj files). They are not compatible in any way to
Antic-Music-Processor sounds. I checked this by loading them into the
editor of Steven Lashower and they did not work (nor could they be
played back from the editor or its separate autoplay-program). -Andreas

You will need to order two devices. First there is the video converter (VGA-801). That comes from Matco a place in Illinois. Then there is the cable itself from B&C. Here are the websites:

http://www.myatari.com/
http://www.mat-co.com/

Good luck....

> Before you buy.

Well,
if you want to load such a CTB program from a "Gamedos" (or something
like that) I do not know of any program that will link or append the two
files together. But you can always use the Autorun.CTB method of the
Runtime library to autostart a CTB file (and let this file start/run
other files if needed)...

Anyone who knows about such a program, please help !! -And by the way:
Is there any program for the A8 avaiable to de-compile (un-compile,
re-compile, ...) such an CTB file back to a normal Basic or Turbo-Basic
listing ?!? - Andreas

Sorry to tell you, its a joke, hence the wicked smiley..

The joke being that if you look at all those games they basically look like they came off a construction kit because they look so similar.

Sorry about the confusion

Yes, there were about that many computer magazines for Atari. Compute! was
aimed at the entire personal computer market (C=64, IBM, TI99, TRS80...) and
published for at least 8-9 years for probably 90 or so issues.

-Ron

I don't have a solution but I admire the problem.

I had serious doubts the auction was legitimate (anything that cool without
a picture raises serious doubts in my mind,) and I guess it wasn't.
Check out how it ended: eBay shows the auction is over, 0 bids, minimum bid of
$9.95. When I checked earlier today, the machine had 20+ bids and was
over $1200.

Weird.

>a chance.. That's why machines like the Lynx, The St book, The Midi
>concept, Porfolio, Cdar, Jaguar etc.etc were too avante garde (to use
>your phraseology) or too next gen.. to be considered current

When you've got something that's ahead of its time, the problem,
fundamentally, is convincing the general public as to why they should
need or want it, and backing it up with potential long term support to
prove that it's not just a passing fad. This can take quite some
time. Look at the CD-ROM. Philips came out with it in 1984. It took
a good 6 years before it became popular enough to be considered any
kind of standard. Video games were considered a passing fad for
years. Even IBM made an early Gates-esque sound bite back in the 40s
when the CEO of the time said, "I think there's a world market for
maybe 2 computers."

Of course, computers back then were the size of IBM's head office...

Nevertheless, my meandering point is that Atari didn't have the patience or the long term strategy to release something, then back it up with lots of support. Moreover, their reputation of vapourware had jaded the general public's confidence in Atari's ability to carry out any promises of support. The Lynx barely had 100 games released for it. The Jaguar had about half that, including JagCD games. They just didn't hook enough developer interest to keep either platform going, and that in turn didn't hook enough public interest to sell either platform in sufficient numbers -- though the Lynx outsold the Jag by a fair number, probably because it was the first colour portable game system. (The Jag was also the first 64-bit console, but the debate over whether or not it was truly 64-bits kept RGVA hopping for months, and to be quite honest, there were VERY few games that truly exploited the power the Jag was capable of)

>If Atari had been on the ball, It would have taken a leaf out of IBM's
>book, in that IBM's PC only became successfull, not because it was IBM

>problems it had in the early 90's The Amiga would have taken the lions
>share of the Video and graphics market from Apple, since more people
>and companies were using Amiga then Mac's

I dunno about that. IBM and Apple both fought tooth and nail against clone manufacturers at the outset. Besides, the interest in manufacturing clones stemmed from the popularity of the platform they wanted to clone in order to get a piece of the action, and while the Atari platform had a loyal following, it didn't have the kind of numbers that would have attracted clone manufacturers; to be brutally honest about it, there simply wouldn't have been enough money to be made to make the endeavour worthwhile. Besides, Atari never would have licensed the technology. Doing so would have bit into their profits, and in turn have caused Atari to lose money, since clone manufacturers probably would have made their clones cheaper than genuine Atari machines, which would have forced Atari to lower their prices or go out of business even earlier than they did. (Unless Atari's licensing fees were high enough to balance their books, in which case clone manufacturers probably wouldn't be interested)

Plus, the PC's popularity wasn't due simply to the abundance of clone manufacturers. That little Washington-based company known affectionately as Micros~1 had a great deal to do with the burgeoning popularity of the platform by providing a popular GUI that, probably for the first time, made the PC a heck of a lot easier to use than plugging away at a DOS prompt.

Of course, the fact that Microsoft had a habit of buying their competition and any other company that could benefit their growth outright also had a lot to do with it, too...

>What Atari should have done was to have licenced out the A800 in '82,
>the ST/e about 87/88, the falcon at about 90/91, and also licence out
>the Jag/Lynx tech.. shortly after release, That way Atari would have
>stemmed to flow from Atari to PC/Mac, Microsoft wouldn't be anywhere as
>big as they are now, And Atari would have being the standard PC config..

Atari _did_ license out the Jag technology. The first result of this partnership, which became known as the CoJag, was a popular arcade game called Area 51.

Oh, and Microsoft would have been as big as they are now. If Atari had become as serious a contender as your depiction makes them, Microsoft would just have bought them. :-)

>Still, we can only dream... Although, as much as though I would like to

>to start marketing Cray's or Compaq's... It's unthinkable, so why are
>we letting it happen to an Institution like Atari, A organisation I
>trust we still care deeply about

Actually, it's quite thinkable. Atari developed software for other platforms. Any time you see an Atarisoft or Tengen title, you're seeing an Atari title. Atarisoft released a number of games on the Sinclair Spectrum and Commodore 64. (Ms. Pac Man springs readily to mind) Tengen typically released Atari Games arcade ports such as Hard Drivin', S.T.U.N. Runner, etc.

Oh, and for a bit of trivia, DRI developed a version of GEM for the PC many years ago. (Don't ask me for it; I havn't been able to find hide nor hair of it...)

As to the issue of Hasbro's pimping of the Atari name -- personally I don't really like the idea that Hasbro's just using the Atari name to sell games and get cheap licenses of Atari's library. But to think of them getting back into Atari's roots and making hardware? Consider this: none of Atari's original engineers work for Hasbro. In fact, no one who had anything to do with Atari hardware works for Hasbro. Given this, any hardware Hasbro may ever decide to make with the Atari label would be made by Hasbro employees, not ex-Atari employees, so any hardware that's released couldn't be considered Atari in anything but name. In all likelihood, it wouldn't have any of Atari's hallmarks -- slick design, forward thinking, features as standard that no one expects as standard, all at an affordable price. No, if they released any hardware with the familiar Fuji sticker, it'd still be Hasbro-made as far as I'm concerned.

Yes, and the mainframe held barely a megabyte of information, at least that was the case of many of the mainframes I have seen (at least it seemed that way, again, it was still meander as compared to every other modern computer system, those with a few TBs esp.)

5470. XL Questions...

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-30 03:22:08 UTC
From: Jessica C <beadsandbangles@earthlink.net>
Message-ID: <39AC7E2C.1B3A7A02@earthlink.net>
Source record: 42320

Hello Atarians, hackers, jybolac-ers.

I have a few questions that are going to require a little knowledge in Atari history, in particular the XL series.

1- 1400XL computer. 64K ram, 24K rom, 6520C processor, built in 1030 modem. Speech synthesizer. Why is this unit included in a "catalog" of the XL systems but is not readily available? The unit was supposed to be out by September of 1983, why did it not come out? Not profitable enough? Or was the unit released to low demand?

2- 1450XLD. Sounds ingenious for the time, looks almost like some of its predecesors like Apple II with the built in drive, modem, synth, etc. 24K rom. I have seen the unit up on eBay for $1200 but what I am really wanting to know is why the unit was not released. Ahead of its time, in true ATARI fashion but never releasd, huh? Supposodly to hit the market in October 1983.

So, I must ask why not? It compels me to wonder and ponder the reasons why not. Anyone know or can make an educated guess?

Thanks,
Jessica

5471. All this talk of old games vs. newer ones

Newsgroup: comp.sys.atari.8bit
Date: 2000-08-30 06:26:35 UTC
From: dr_ovid@my-deja.com
Message-ID: <8oi9ecdbc1@nnrp1.deja.com>
Source record: 42321

This subject reminds me of some feelings I have had recently. I have played and enjoyed the truly wonderful games of Privateer 2, Freespace, Freespace 2, and Tachyon for my tricked-out PC, and they are both excellent space flight games, and are great games in general. But none of them compare to the fun factor of that all time favorite, Star Raiders.
There was always a sense of urgency and purpose in SR that has never been completely duplicated (though FS2 and Tachyon come pretty close). For all the pretty graphics, amazing sound, and awesome force feedback in the newer games, seeing the rank that you EARNED at the end of SR, and then thinking "I can do better", will always make it a game for the ages.

And then there's Alternate Reality (I clump the City and Dungeon together for sake of ease). I've played dozens of rpg/adventure games over various game/computer systems for 20+ years and I've never felt so involved in a game before (though System Shock II is an extremely close 2nd). Creeping down dark corridors, or staggering down rain soaked alleyways while low on health, dodging diseased rats and night stalkers while wishing for better weapons is probably the best experience I have had in a game. New games like Diablo II are excellent of course, but 15 years from now, D2 will be long forgotten, and I will STILL be whistling the tunes from the City's establishments.

Dr. Ovid

P.S. I've been following the recent thread on AR, Mr. Price, copyrights, etc. with enthusiasm. When is the last time anyone has heard from Mr. Price? I was really fired up about the AR online thing and was heartbroken to hear about it's demise and unlikely revival. Any update on this?

If you understand German, try www.atari-computer.de/abbuc and look at the preview (before the next ABBUC magazin comes out). It has what seems to be a very simple upgrade for the XF551. The story only mentions the XF551 but says it will work on the 1050 too. AFAIK this is 720kB drives only.

If you do not understand German, try the Email address mentioned on the same page.

It's www.atari-computer.de/atreju

The hardest part about the upgrade would be finding a special version of some chip. IIRC it's the 6532. You need the 4MHz version.

I hope most of us realise that voting just means choosing the bad to keep the
worse out of office.

BTW millions of people have died, will die or would die for the right to vote.
It is our moral duty to use that right, otherwise their death was useless.

On a slightly lighter note:

Why didn't anybody bite on this one?

> (Pat, not Mitch. If I had to choose between the two, I'ld choose Mitch.
> With Stefanie as his running mate. (I'm more of a leg man, than a boob man))

>test and mail to you for $10 US plus shipping.....

One important thing to remember about printer interfaces: A printer interface
has to translate the Atari EOF (0x9B) into LF (0x0A). This translation is
usually good, but may corrupt the data you print as graphics. Therefore, one
IMHO important feature of a printer interface is the ability to turn off
this automatic translation for graphics print.

Since I see no answer, lemme give it a try.

There are two utilities AFAIK, one from CSS and one from ICD. I have seen a test (in either ANTIC or ANALOG) that say the CSS software won hands down.

I never used backup software. (maybe I shouldn't say this out loud)

I have NO clue where you could get the ICD software, maybe Bob Klaas can help you there (bobkla19@sisna.com).

CSS can be contacted via www.nleaudio.com/css

>Runtime library to autostart a CTB file (and let this file start/run
>other files if needed)...

No, that won't work. A "game dos" does not link in a D: handler into HATABS,
hence making the autorun.ctb unavailable for the runtime library.

Well, I'd say it wouldn't be too hard to link the compiled program to the
library, but I've personally no interest in this. Requires a little hack to
the runtime library startup code to start execution at a specific address.

>Is there any program for the A8 avaiable to de-compile (un-compile,
>re-compile, ...) such an CTB file back to a normal Basic or Turbo-Basic
>listing ?!?

Not that I know of. For the ABC (Monarch Data) compiler, yes, but it compiles
programs into a p-code, making this step, well, not precisely "easy", but
simple enough to be feasible. The TurboBasic compiler, however, really
generates object code, which is even optimized a bit as well, making the
decompiliation quite hard.
The trick was hard enough for ABC, I doubt this is possible for TurboBasic
without really really really (yes, I mean it ;-) tough work.

Once upon a time <savetz-FA6E0D.18084130082000@news.northcoast.com>,
Kevin Savetz <savetz@northcoast.com> grabbed chalk and scrawled:

>I had serious doubts the auction was legitimate (anything that cool without
>a picture raises serious doubts in my mind,) and I guess it wasn't.
>Check out how it ended: eBay shows the auction is over, 0 bids, minimum bid of
>$9.95. When I checked earlier today, the machine had 20+ bids and was
>over $1200.

It seems the seller cancelled the auction due to a fault in the 1450XLD
that caused it to not format a disc. Now, XLD's being what they are
(rare), I doubt that would put anyone off, frankly - 1050 mechanisms are
hardly rare.

Sounds like an excuse, and it was either a test auction from someone
wanting to know what they might get, or a dickhead trolling - though
their feedback would suggest otherwise. Perhaps they were given a bid
outside of the auction.

None of their previous auctions have pictures. I suppose some people
still survive without digital cameras or scanners!

My guess would be that either the LS138 or the MMU are broken.
Try the LS138 first, they are cheap and can be had in every electronics store.
After you desoldered a chip, solder in a socket. That way you do not have to
desolder that chip again, should it fail (again). Buy the quality stuff, with
the round pins. They hold the chips in better.

DO NOT DROP THE COMPUTER. (Unless it's a PC. But that's another storie)

Re: broke pin of OS.

Ouch! Solder in a quality socket and order a new XEGS OS at BEST Electronics
or B&C Computervisions (www.best-electronics-ca.com and www.myatari.com IIRC).

Also remember, the MMU in the XEGS is different from the MMU in the rest of
the 8 bit ATARI'S.

>does though.

The 850 will do split baud rates (1200/75 and vice versa) as used in Europe and even 19200 is you program the right addresses in the right way. (might take me a while to find where I found this). I even have seen a utility that is - according to it's description - able to switch on hardware handshake.

The former I know for sure, the latter I don't know. I have heard the 850 will do a bit a hardware handshake, but not everything. What That is supposed to mean I do not know.

While this is true, you can run a SIO2Pc cable from a Atari 800 to an Atari (1040) ST (thus making it a SIO2ST cable) and run virtual drives off the Atari ST.

That is what I do to matter the fact. You need an ST with at least 2 meg of ram to have this work however. My 1040 ST has 4 meg, so this is not a problem here.

(the 1040 was to indicate 1 meg of ram, just like a 520 ST was indicating a 512K machine, so technically I have a 4160 by Atari's standards.) :)

In my opinion, the Atari 400/800 is great in style, games, sound, and graphics. A topped out machine that was for entertainment and did that well.

The ST line had it's share of games, though to me, few have really caught me. Perhaps they would have had I been an ST user back when they were big. Be that as it may, I have found it to be the best device to pick up when Atari left off for applications (Laser printers, virtual hard disk for the Atari 800, internet connections, etc.) Capible of eventually handling PC, Mac, and emulation of a few other platforms, the ST is great hardware device this side of a PC.
Atari 400/800 - gameplay, sounds, graphics.
Atari ST - applications.

That's my two zorkmids.

> with the 8 bit line....

...unless you run ST X-FORMER!

This program allows the ST (moving at 8 mhz only) to act as an Atari XE computer (minus the player missile graphics).

So what you have is a machine that will do basic programs fairly well, accesses Atari 8-bit disks through a special cable GREAT, and has a wonderful filing system. The ".XFD" archive files were started by this program, and of course work with this emulator.
While the disk accessing runs faster than the normal, programs run at 30-50% actual speed.

And there you have it. To date this is the only emualtor I've been able to get work with the ST line, though others exist.

(I would run St X-FORMER, port over .XFD disks from the program to a floppy and run on my regular disk drive. It served (for me and others) as a virtual hard drive prior to "800xldj" and the SIO2ST cable. Once that came along, St X-FORMER hasn't seen much activity.)

...unless you run ST X-FORMER!

This program allows the ST (moving at 8 mhz only) to act as an Atari XE computer (minus the player missile graphics).

So what you have is a machine that will do basic programs fairly well, accesses Atari 8-bit disks through a special cable GREAT, and has a wonderful filing system. The ".XFD" archive files were started by this program, and of course work with this emulator.
While the disk accessing runs faster than the normal, programs run at 30-50% actual speed.

And there you have it. To date this is the only emualtor I've been able to get work with the ST line, though others exist.

(I would run St X-FORMER, port over .XFD disks from the program to a floppy and run on my regular disk drive. It served (for me and others) as a virtual hard drive prior to "800xldj" and the SIO2ST cable. Once that came along, St X-FORMER hasn't seen much activity.)

I read the instructions for replacing the 720k 3.5" drive in a ST with a 1.44 some years ago. I have forgotten most of the info so if you want some part numbers and actual techniques you would have to find the original hack.

As much as I can remember, the ST and XF 551 both used the 1772<?> floppy controller. The modification to the ST required adding a glue chip<divide by N type counter> to get the clock right and perhaps a 2X faster crystal.

I seem to recall there was one other modification/hack, something like head step value or special formating program. I never did the mod myself so I don't have any idea what compatibility issues there were.

Then came the Ajax chip which made the hack for 1.44 kind of obsolete.

I use HD Backup Pro from CSS. It is the only HD backup program I know that will backup one hard disk partition to another hard disk partition. Since I've got both a Syquest drive and Iomega zip drive connected to my BB, backups are fairly simple. I think the only restriction is that the partitions must be the same size.

Here's a different opinion. Several years ago I was obsessed with getting a 1.44 drive for the A8. The HDI was already out of production, so I purchased a Black Box and Floppy Board. Since it is a parallel device, I don't think that you will find any floppy that is faster, especially when used with 1.44's (since there are 36 DD sectors/track). (APE at 3X on a PC is fairly close and several hundred $ cheaper.) But since I had the Black Box, and my goal was to back up my floppies on as few disks as possible, I got a SCSI Zip drive. ($99). Runs almost as fast as a true hard drive, and 100 MB per cart. The only downside is the 16 MB partition and 64 file limit on MyDos, but that still means 6 - 16 MB partitions per Zip. But... back to the 1.44. Guess what -- I have found that 1.44's diskettes are not as reliable as 720's (in my experience). So the long story short, I use very few 1.44's, but use quite a few good (brand name) 720's. There are also several options for 720's, so (IMO at least) they are a very viable alternative to the uncommon and quite expensive 1.44 drives.
But if you *really* want a 1.44, then the BB/FB is the only game in town. I guess I should add, too, that the FB also does 1.2's, and 1.2 drives are dirt cheap.

Hey gang!

Well, it's 8pm and the chat server is currently down. Knowing my friend
who put this up for us he wouldn't have this down unless there was a good
reasons (aka.. massive computer campus server problems or other mundane
issues.)

With that in mind we hope all get ironed out back at SWAU (where the server
is) and I guess we'll take a break for one week.

Considering all the great chats we have had since.. May? I guess we could
take a break. :)

Good night all, see yall next week.

I have a 16k buffer U-Print that did that (translate all 155s to 13 10).
And what the other person said is correct. It can/does mess up
bit map graphics printing.
My Ape interface and 850 and P:R: and MIO don't do that. There
is no switch on the U-Print to turn the translation off, either.
I always thought it wasn't a good idea for the print interface to make
translation like that. Most or all printing software, word processors,
put out the 13 10 themselves, no need for the interface to do it.
There may be some programs that put out 155s, for Atari SIO printers,
I don't know. I never had a problem with linefeeds, I did have problems
with the U-Print messing up graphics.

The clock of the 1772 needed to be 16Mhz, tho halve the step rate, thus 1.44. You need the WD 1772-02 or an ajax, as earlier chips cant tolerate that frequency. The circuit used is a simple switching circuit that monitors HD detect from the drives and decides whether to go 8 or 16Mhz. The 16 Mhz could be tapped from the Shifter or the Glue. Also the HD detect usually needs inverting......

>this automatic translation for graphics print.

I thought the P: handler did the $9B --> $0D $0A transform? Otherwise, ALL known interfaces (850, MPP 1150, ApeFace, U-Print, ATR8000, CardCo) shifted the graphics data; the G: device even altered one byte of an inverse character bitmap to avoid the 155 glitch.

Almost any interface will connect any centronics type 36 pin parallel printer. Depending on intended usage, there was even a home-built joystick ports 7-bit ascii interface published in A.N.A.L.O.G. #15 or #16; it required some vbi software so would not support commercial software like Letter Perfect ot AtariWriter. Worked fine from BASIC or DOS or Assembler or other application to which you could append your Autorun.sys.

Don't know if they are in any way related, but.... Back in May of this year
I was the high bidder on a 1450xld that also got "pulled" from E-Bay just
before the
end of the auction. The reason given at the time was a faulty voice
synthesizer.
E-mailed seller at that time and politely told them that I didn't care and
would
like to buy the machine. Received very nasty message telling me (basically)
to
stuff it. Thought the seller name/E-mail address this time are different,
seeing "Jersey Shore" and the lack of a picture (just like the time before)
made me very
cynical about the whole thing. Deja Vu all over again...

Best to all...Rich Jackson

Reminds me of the auction back in May for the same hardware. Auction at
that
time also ended early with the "reason" that the voice synthesizer didn't
work.
Since I was the high bidder I contacted the buyer saying that I didn't care,
I would
like to buy the machine. The Nasty response I received basically told me to
"stuff It".

Even though the username/E-mail address are different this time...seeing a
"Jersey Shore" location and the lack of a picture (just like in May), made
me
very cynical about the legitimacy of the whole thing.

Thanks..
Rich Jackson ("8bitfan")

5516. Rebelstar 2d Turnbased remake of 80s classic

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-01 05:49:33 UTC
From: Czar <ralph@zap.a2000.nl>
Message-ID: <opguqsg2rh1lmkktffg270bc5hq2ur3nan@4ax.com>
Source record: 42283

Freeware game
http://people.a2000.nl/rwesseli/delphi.html

Welcome to Project Rebelstar

Rebelstar Return is based on a game
by Jullian Gollop which came out in the
1980s for the Spectrum and the Amstrad
computers.

This version is based on the Amstrad
version as that was the one I used to
play. After replaying Rebelstar using
an emulator, and being frustrated by the
user interface, I decided that would
rewrite it. It would be a nice project
that I could do to see if I could
actually program something. I
am not a programmer and so this has
purely been done as a hobby.

This program is not yet finished. At the
moment it is set up to only play
Rebelstar and Luxor F-242. The intention
is that it will also to play other types
of games using different graphics and
maps. The first one will be a Fantasy game.

Many aspects of the game have been
implemented and the game is playable.
However, there are a number elements not
yet realised.

1. Opportunity fire (overwatch) is
implemented for both the Raiders and the
Operatives. Note its non-directional.
Soldiers in overwatch are marked by a
little white circle. If a soldier in
overwatch is shot then they are removed
from overwatch.

2. Reinforcements are available, set up
using a simple scripted event. When the
five laser defence units are destroyed th
reinforcements will arrive.

3. There are still a number of bugs.
There are some problems with screen
updates. And when walking with one
character do not select another before
move is finished. There are probably
many other bugs and problems please email
them to me, preferably include a saved
game if you think it helps.

4. It is not yet possible to pick up items.

5. The MediKit works - select the MediKit
from the equipment list and then click on
the wounded soldier. Both the medic and
the wounded soldier should stand next to
each other. If treatment is possible,
both soldiers forfeit their remaining APs
for that round. It is possible to heal
the healer. Soldiers carrying a MediKit
are marked with a tiny Red Cross symbol.
Wounded soldiers are recognisable by a
red dot
6. It is possible to reload weapons,
select the ammunition from the equipment
and if the cursor changes to a point hand
click on the main weapon in the top slot
of the equipment list. This will reload,
any remaining bullets in a weapon are
currently discarded.
7. When a soldier is selected you can use
the Right Mouse Button to click on screen
to get movement cost indication. This is
not entirely accurate as it does not take
account of doorways, this may be
rectified at a later date.
8. Difficulty levels are also implemented
but at present the main difference is
the number of foes to face.

==========
Hardware Requirements

No idea. However you should have
a sound card, and a reasonable video
card. I have tried running it on a
Pentium 200 with a 4 meg video card and
had no problems. I wrote it on a dual-
celeron 450Mhz in windows 2000 using a
Asus TNT2. I have also tried it on a
Laptop with an ATI videocard.

If you have hardware that does not work with
this program or shows major quirks please email me.

email to : Ralph@zap.a2000.nl

The program was written using Delphi 4.0
and DelphiX. At the moment I have no
plans for releasing the code. Mainly
because its such a mess. I am not a
programmer, I wrote this program as a
hobby. However, I haven't said that I
can't be persuaded.

Updates will be available at

http://people.a2000.nl/rwesseli/delphi.html

at least until 2002.

There is a Map Utility and if people ask
I will make it available. It is a bit
crude but works well enough.

==========

5517. Re: The 810...

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-01 06:18:10 UTC
From: KK <kelcey@hawaii.rr.com>
Message-ID: <8tfuqsgf1mhh88avp7micn41bdppgk2ktg@4ax.com>
Source record: 42284

I spent 9 weeks during the summer of 1982 working on the island of Lanai in Hawaii, picking pineapples at the age 16 and came home to Honolulu with $800 saved after room, board and airfare. (It was the hardest job that I have ever had to do, but I then learned to appreciate that perhaps education may be the way to go in life.) I then promptly bought an Atari 800 from our local computer shop Data One. That was it. Nothing else. I soon realized that I needed an Atari 410 or one of those miraculous 810 drives with 88k capacity!

I worked my ass off for the entire Summer and so did hundreds of other high school students from Hawaii and from BYU Utah. I blew my entire Summer's pay for the basic Atari 800. No software bundles like nowadays.

My parents were cool and bought me one of those new fangled 810's after about a month for I believe around $500 and also later bought a color monitor after I complained that I can't program to my fullest capacity with a black and white portable TV. 810's seemed like a miracle back then. Too bad mine just spins and spins and spins without reading. It must be due to my immature behavior back then when I pulled my hair trying to program in basic, then assembly language (which was a total mystery to learn back then and still is now) and getting uncontrollably upset while playing Shamus trying to complete the game without a save feature! (I beat the hell out of my drive because sometimes I thought it was moaning and groaning too much and wasting my time!) I'm still unsure if I ever did finish Shamus. I do admit that I did finish and become a "field marshal" in Castle Wolfenstein though. Now that was a proud day when I was 17. Will I ever have days like that again?

Unfortunately, I did not jump on the "silicon bandwagon" when things were so fresh and new, but I can tell my children, when I ever do have them, that I grew up during birth and the development of spectacular new technologies and the emergence of personal computers.

Anyways, I ramble on. I just wanted to put in my 2 cents after lurking for a couple of months. I have fond memories of my Atari days. To have an 810 in 1982 to me was like being one the first kids on the block to have something really great and new.

Aloha from Hawaii.

Kelcey Kim

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

5522. TION] CATBOX w/ extras on Auction for another 5 hours....

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-01 08:46:10 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <0004.39afdd0d@fmlynet.org>
Source record: 42295

FamilyNet HQ: Telnet:\\www.family-bbs.net

(Knowing that some here are also Jaguar fans as well...) :)

The ever elusive (and rare) CATBOX is on bid right now at....

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=419606763

Comes with a complete Jaguar still in the box, 2 controllers, and an Atari SC 1224 which has an adaptor that connects up to the catbox. Nice unit!

The bid is up to $100 right now.

You figure a Jaguar sells for around $30 these days in the box, an Atari monitor you can pick up from a thift store for $5, so you would be picking up the CATBOX for a little over $65!! That's less than what you will be paying for Battlesphere (which is around $75+ and worth every penny too!)

The CATBOX will give your Jaguar options not previously available. Two great examples are....

1) Greater range of monitors that can hook up to your Jaguar. The CATBOX expands the existing A/V port and makes more than just RF signal TVs and video monitors available. With the Catbox, monitors with sharper pictures are possible (at least the RGB style like the Atari SC 1224, which comes with this package)

2) Connectivity to up to 16 other Jaguars! Sure the JagLink could connect you to another Jaguar. What wouldn't it be great to get more than two Jag players together for a multiplayer round of Aircars (up to 8 players possible). And there has not YET been a player session where all 16 players were connected up for a session of BATTLESPHERE. Wouldn't it be great to attend a JagFest and be able to help make this awesome event a reality? :)

What? No Battlesphere? Well stay tuned to this newsgroup, the 2nd release is right around the corner.

The Catbox was a great addition to a Jag as you can see, to which the creation we will thank ICD for. Unfortunately, it's been years since new Catboxes have been made, and people have had to trade with others as far away as Europe to get a Catbox these days. Catbox units go for high dollar amounts, and extensive trades. And yet, a Catbox is available in the states, and with only five hours on the clock!

Don't let this pass you by!

no, it's not in the manual. The driver must be modifyed to do that.
Not sure if the 850 would be able to keep up at 19200.

Most printer interfaces translate the $9b to $13 and that is it. That
is why printers must be set to CR after line feed. Atari ones are the
exception. Most programs take into account the 155 - 13 translation
and avoide 155 all together. 153 is used instead IIRC.

Unfond memories: I can remember doing my own graphic dump programs, but it
has been so long I can't even remember why I did it rather then just use an
exisiting program. Wrote dumps for Axiom,
Citizen, Epson.

Early on when I was still new to Atari I do remember literally spending days
dumping the same file over and over and having it glitch 1/2 way through the
dump due to a '155 in the data. After I finally figured it out, I took a
less then optimum approach and output 200 single pixel height lines. I think
eventually I did write a dump that did two 4 bit lines to feed the data a
little faster.

5526. APE and ProSystem cables

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-01 13:03:19 UTC
From: Mike Kohary <mkohary@earthlink.net>
Message-ID: <39AFA917.85A47D1D@earthlink.net>

On the APE website, I notice that there are two cables for sale there - one called an APE cable, and the other a ProSystem cable. The pictures are identical. Are these really two different cables, or just the same cable under two different names?

I know I'll need the APE cable, but I need to know if I'll need the ProSystem cable for copy-protected disks.

Thanks,

Mike

Two slightly different cables, but not compatible.
>

You only need an Pro cable if you want to make a backup copy of your copy protected disks. If you are comfortable with either continuing to use the disks from a real Atari drive or getting a copy off the net, then the cable would be redundant.

Thanks for the info. I have lots of "collection" disks, and I'm not
sure how well protected they are (if at all). I'll just start with the
APE cable, and if I have problems, I'll grab a ProSys cable as well.

The seller cancelled all of the bids since the drive in the computer would not format a disk. I think that the $1200 was a fair price, working or not, on this great unit. Once an Atarian, always an Atarian, no matter how much it costs. Not like I have $1200 on retainer at the moment...

HOW MUCH!!!!!!

About 500quid for a broken machine??

Rare or not that's obscene..

Only really frustrating thing about getting old is when you want to remember something accurately, but just can't pull the details in from dead brain cells.

Someone correct me if I am wrong, but isn't this the 2nd 1450XL that went up forsale on eBay with the same results? Seller pulled out with a very thin excuse?

Welp, managed to put together a couple different styles of functioning SIO2PC cables (one to connect the pc to the Atari and another to connect an Atari drive to the pc) So far I have just been using my pc as a virtual Atari drive to play The City, so far without any problems. It does load a bit faster. Suffice to say, I now have a working copy once again. Hurrah! Kudus to those hard-working enthusiasts for their tireless efforts. Maybe, someday, when I become more adept, I can repay the community in some way.:)

Going to see if I can properly port over the disk image from the pc over to my Atari drive.(converting it back to a usable format will probably take me a few tries... heh. Hey, I'm learning!.)

Tasha- Happy once more.

5534. FS:USA:ICD Multi I/O 1 Meg Version

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-01 22:18:07 UTC
From: phantomm@eastky.net
Message-ID: <8op9uv$579$1@nd.eastky.net>
Source record: 42202

I have for sale an ICD Multi I/O (MIO) 1 Meg Version.
Comes with Original Manual and Software.
Power Supply, Printer Cable, RS232 Modem Cable, 130XE adapter which
also has 2 cartridge ports.
Also includes an Adaptic 4000A controller card with cables to connect
MFM type hard drives to your 8-bit Atari with the MIO.

The 1 meg version of the MIO is a fairly rare item and this one is
in excellent working condition. I have only used it for a short time
and it has been stored properly to insure that it remained in excellent
condition. Was planning to keep it but am running out of storage space
and would like to see it go to a good home.

Price is $200 US Dollars, plus $15 shipping anywhere in the USA.
Insurance will be a few dollars more. I do require payment first.
A US Postal Money Order is a good way to go for payment.

As a Bonus I will also include an Animation Station drawing Pad with
original manual and software and a PQ (The Party Quiz Game) that includes
4 Controllers, Original Software Game Disk(s) everything needed to use
this Triva Game system. I will also include some other original Atari 8-bit
software or hardware of my choosing as a Suprise Bonus.

E-mail me about the MIO only if you are very serious about purchasing it.

The MIO will be sold to the person who can get payment to me the fastest.

Thanks,
phantomm@eastky.net

Source record: 42205

I have both cables and am glad I do. The PRO cable connects the PC to my Atari drive and creates *.pro files on the PC from protected disks. Conan, Trains, Hacker, and Atari Macroassembler come to mind. Then I use the APE cable connected to my Atari 800 and APE running on the PC to use that software from my PC hard disk. The Atari thinks it's doing all the protected "grinding" of an Atari disk drive when it's really just sending and getting data to and from the PC.
If you look around though, the APE cable might be enough, because I know that there are unprotected versions of this software around if you look. The PRO system works well though if you want to backup that protected software you still have and can't find anywhere else and want to save to a PC hard disk.

Another one down, 6 to go ....

Following a recent clear-out, I still have the following ROM cartridges
available for sale (all with boxes & instructions etc):

BALLBLAZER
BLUE MAX
DAVID'S MIDNIGHT MAGIC
DESERT FALCON
FOOD FIGHT
ONE-ON-ONE BASKETBALL

Asking price is £4 (GB POUNDS) each + postage cost. Willing to ship overseas
if required.

Please email paul@stillavailable.co.uk

5540. FS: Atari Books

I have the following Atari 8-bit related books for sale:

"Computer Animation Primer" by David Fox and Mitchell Waite,
Byte/McGraw-Hill; classic book about computer graphics using Atari 8-bit
examples. Good, clean condition.

"Atari Adventures" by Tony Bridge, Sunshine Books. A guide to playing and
writing adventures. As new condition.

"Writing Strategy Games on your Atari Computer" by John White, Sunshine
Books. Techniques for intelligent games. As new condition.

Willing to take offers on all the above items (in GB Pounds please) and will
ship overseas if required. If interested, please e-mail
paul@stillavailable.co.uk

5541. Cute int sqr program

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-02 18:15:56 UTC
From: Rick Cortese <ricortes@netmagic.net>
Message-ID: <sr2gt4dvc5d17@corp.supernews.com>
Source record: 42210

I am still trying to get up to speed on DSP chips and saw this posted in comp.dsp

http://www.pedrofreire.com/crea2_en.htm

I have my own methods of course, but seldom use sqr in any of my programs. When I have used sqr my techniques either had a rounding error i.e. sqr 8 => 2 or some extra code to take care of this or tables which were kind of long.

I didn't bother to translate this into assembly or Action!<yet>, but did a quick and dirty basic program for those that don't understand C like his example is written in.

```
10 INPUT X
20 X=INT((X+1)/2)
30 R=0
40 IF X>R THEN X=X-R:R=R+1:GOTO 40
50 PRINT R
```

Pedro's method works much better then mine. For instance, the sqr(3) is 1.732 which his method rounds up to 2. Ditto for things like [80, 81, 82] all come back as 9.

the
>Atari 8 bit computers? I found one for my old Apple IIc, and I would be
>interested in finding one for my favorite computer...my 130xe.
>Thanks!
>Steve B.
>

I once started to code a GUI, if there is an interest and other freax to
help me, I could start up again.
One thing is, who will use it?

But I think a "fake"-GUI in GRAPHICS 0 which can replace the DUP.SYS for ALL
DOSses (ATARI DOS, MyDOS, ..)
would be a usefull thing, cause I can implemnent some sort of
memory-management for extended RAM, which everybody has.

I would use a graphical program launcher, where the files would appear
as icons you can click on, and then if there were some way to exit the
launched files back to the GUI that would be great.

Nice to see lots of Atari dudes (and dudettes) in 'Atari'cyberspace

Anyway re: 1450 xld on ebay, I just thought that i would correct the person/individual who confused the 1450xld drives with the 1050

The 1050's drive mech's were either from World storage or Tandon (according to Best Elect.) the XLD drive mech apparently were from Epsom, and also another thing the individual forgot is that the xld drive mechs were dsdd (double sided double dens) the 1050's were sssd/ssed (figure that one out)

Also I knew someone in the UK that had a 1450xld, the silly mug sold it for less the 200 sterling 6 years ago, he also had a proto version Atari 1200xl, he couldn't have sold that for less then the 1450 (surely not)

I did once have a 'very rare' 1064 ram upgrade for the 600xl (couldn't remember what happened to it)
I say 'very rare' because apparently Atari's US warehouses were apparently full of pallet loads of 1064's... Is there any truth in this story.. so much for misplaced inventories, perhaps Atari should have buried this lot were they dumped the ET carts (when they didn't sell) only joking ofcourse

Atari's CDar, now thats another story! (for another time)

Keep that Atari's Humming, & Happy Atari'ng

I seem to remember a passage in a famous book about Atari called "Zap the rise and fall..." It said that Atari overdesigned the vcs, it said Atari designed video games at a price point that the consumer could afford... Lets get this right Atari were designing 2 or 4k games when IBM were selling 64 and 256K chips by the ship load... Who's kidding who here
Are the consumers who are buying 2 or 4k Atari programs the same people who were buying 64 or 256K chips from IBM by the shipload

What would have happened if Atari hadn't settled out of court with Activision in 1981, as some commentators have stated that 3rd party games development was still 10/15 years off... Nintendo would have still been selling Mario on the 8bit nes, Sega would have still been writing software for Atari, and sony would have been a name only associated with cd's and walkmans

It's strange how many people forget Atari's effect on an Entire industry Looking at it logically this would have encompassed a number of industries

A- Consumer Electronics,.. Because Lets face it The Industry known as consumer Electronics didn't exist as such untill Atari release Home Pong

B- Computer Industry,... Didn't realy exist untill Atari released the VCS, After all as Steve Meyer later admitted, The original Atari 400/800 were nothing more then Advanced versions of the VCS

C- Video games... Video games didn't take of till Space Invaders (admittedly not an Atari product), but Atari was the first company to bring video games to the consumer, and there fore into the home, after all the first 3rd party video game released was an Atari version

D- Computer H/W Design concepts... Antic Pokey C/G &Tia evolved into what we now call Banshee, Nvidea, Gforce etc.etc. Midi (Atari was the first and only computer to incorporate this as standard- forget msx and apples attempt) Atari's Dataglove became Mattels Powerglove.. ;Bank switching... has being with us since the VCS (remember the story about the vcs version of asteroids) Plug in memory modules... now called Simms Dimms and DIPPs, Plug and Play concepts (just take a look at the 400/800 internal layout... USB which lets face it, its a reversed engineered version of SIO (an Atari innovation) I find it insulting that an EX ATARI engineer could consider selling Atari technology (and patents) to MS (the guy must have been on drugs... or he needs shooting)

E- Computer Games... Evolved from video games

F- 3rd party licencing... What was that courtcase with Activision all about

G- Interactive entertainment, Interactive TV, online gaming .... I could go on and on

It's a shame that we're not all elephants (who never forget)

Happy Atari'ng

I think the point he was making was that O'Shea's has those carts
available at $0.80 apiece. There have been people in the past who have
bought 'em from o'Shea's then tried to turn around and sell them for
more to try and make a quick buck -- a rather scummy practise. I'd
understand if O'Shea's didn't have any more, but they still have
tons...

Cross-posted to: comp.sys.atari.announce,comp.sys.atari.8bit,comp.sys.atari.st

We've added the full text of eight issues of Antic magazine to
the Digital Antic Project. Here are the latest additions:

July 1983 - Vol. 2 No. 4 - Computing: the New Adventure
September 1986 - Vol. 5 No. 5 - Weather
February 1987 - Vol. 5 No. 10 - Word Processing
March 1988 - Vol. 6 No. 11 - Video Game Shootout
July 1988 - Vol. 7 No. 3 - Newsroom Comes To Atari
June 1989 - Vol. 8 No. 2 - Diamond Cartridge
October/November 1989 - Vol. 8 No. 6 - Money Magic!
February/March 1990 - Vol. 8 No. 8 - Atari Recorder

Our next project will be to get the full text of STart magazine online:
if you're an ST lover with a scanner, OCR software, and some time to spare,
you can help. Send e-mail to savetz@northcoast.com.

I also need to find someone with an expertise in ST file munging and the
ability to move STart disk files from old ST disks to the Internet.

>A- Consumer Electronics,.. Because Lets face it The Industry known as
>consumer Electronics didn't exist as such untill Atari release Home Pong

I wouldn't say that; although it probably didn't have that particular
appelation, the concept of consumer electronics has been around since
the days of radio.

>B- Computer Industry,... Didn't realy exist untill Atari released the
>VCS, After all as Steve Meyer later admitted, The original Atari 400/800
>were nothing more then Advanced versions of the VCS

Not exactly. The computer industry, although still aimed at
businesses, and barring early factory-sized contraptions, could
probably be traced back to 1971 with the introduction of the first
microprocessor -- the 4-bit Intel 4004, which begat the first
Microcomputer, The MCS-4 -- and the first floppy disk ... all 8" of
it. The MCS-4 wasn't a commercially built system, but it did start it
all. At the same time, Nolan Bushnell designed the first arcade game,
called Computer Space, though it flopped. The next year, Magnavox
introduced the first home video game console, called Odyssey.
The first _commercially_ built computer was the Scelbi 8-H, which used
Intel's 8008 chip, and was released in 1974. The Palo Alto Research
Center (PARC) released the Altair 8800 the following year, based on
Intel's 8080 chip. (For a bit of trivia, in 1974, PARC also had
designed and built a prototype of a machine that featured a monitor, a
real GUI, a mouse, and an Ethernet connection. Unfortunately nothing
was done with 'til 1981 when Xerox used PARC's prototypes to create
the Xerox Star, from whence all of today's GUIs originate) The first
Apple I was released in 1975, and used MOS Technology's 6502
microprocessor (sound familiar?). In 1977, Commodore releases the
PET, and Apple releases the Apple II (both 6502-based). This is also
the year the 2600 gets released. Atari doesn't release their first
home computer until 1979 -- the Atari 400. I wouldn't call it an
advanced VCS, though; none of the VCS' architecture is evident in the
400, really.

>C- Video games... Video games didn't take of till Space Invaders
>(admittedly not an Atari product), but Atari was the first company to
>bring video games to the consumer, and there fore into the home, after

>all the first 3rd party video game released was an Atari version

Video Games took off when Atari released Pong in 1975, though they
didn't actually become ragingly popular 'til '77 and Atari released
Asteroids. But even there, Atari is plainly evident pioneering the
future of the billions-of-dollars-a-year industry.

>D- Computer H/W Design concepts... Antic Pokey C/G &Tia evolved into
>what we now call Banshee, Nvidea, Gforce etc.etc.

That's a pretty immense generalization. Dedicated sound and graphics
hardware, while probably being truly first seen in Atari hardware
(i.e. Pong) is still something that would have existed despite Atari
being the first to have done it. It'd be fair to say that modern
display and audio hardware is the natural evolution of these hardware
concepts, but such concepts aren't directly responsible for them.

> Midi (Atari was the
>first and only computer to incorporate this as standard- forget msx and
>apples attempt)

Atari didn't pioneer it, but they certainly made it more popular.

> Atari's Dataglove became Mattels Powerglove..

Atari's Dataglove never made it past the prototype stage, however.

> ;Bank
>switching... has being with us since the VCS (remember the story about
>the vcs version of asteroids)

Yep. They own the patent for that one. Invented by Carl J. Nielsen.

> Plug in memory modules... now called Simms
>Dimms and DIPPs,

How's that? SIMMs were used long before the STE made use of them.
Heck, Apple II machines had plug-in memory expansion cards. Atari
did, too, though they were used through the expansion bus, but they
weren't, strictly speaking, plug-in modules as we know them today.
The RAM itself was soldered onto a PCB and simply issued as a plug-in
expansion. Besides, Apple's came first.

> Plug and Play concepts (just take a look at the 400/800
>internal layout...

That's iffy. The Atari simply tested the SIO chain for the existence
of peripherals along it and, based in pinouts, determined what was
hooked up. Plug & Play as it exists today is rather different; the OS
actually sends a query to the card along the bus, asking it to
identify itself, and the card sends back its information, which the OS
then uses to determine what's there and what drivers to use. This of
course requires the cards to be P&P-compliant, since obviously non-P&P
cards don't have the necessary hardware to accept queries.

> USB which lets face it, its a reversed engineered
>version of SIO (an Atari innovation) I find it insulting that an EX
>ATARI engineer could consider selling Atari technology (and patents) to
>MS (the guy must have been on drugs... or he needs shooting)

USB's considerably more advanced, though -- and faster. Still, it
took them bloody long enough to come out with it!

>E- Computer Games... Evolved from video games

Same thing, really... arcade units are really just computers without a
proper OS or a keyboard... or, looked at another way, computers are
expanded arcade machines. (After all, the processors we used in our
machines were all once the heart of many arcade games)

>F- 3rd party licencing... What was that courtcase with Activision all
>about

A bunch of disgruntled Atari exployees, comprised of David Crane, Alan
Miller, Larry Kaplan, Bob Whitehead, and Jim Levy, got fed up with not
getting any recognition or enough money for the games they wrote for
Atari, so in 1979 they all buggered off and, in 1980, formed
Activision with Levy as the CEO. Atari then sued them for allegedly
violating their non-disclosure agreement. The battle went on for
about 2 years until they settled out of court and allowed Activision
to develop third party games for the VCS. On that court judgement,
dozens of companies began flocking to the Fuji to develop 2600 games,
and the rest, for better and worse, is history.

>G- Interactive entertainment, Interactive TV, online gaming .... I could
>go on and on

This I can see, but not specifically of Atari. Rather, the Gameline
for the 2600 pioneered that. Unfortunately, it flopped, though the
tiniest kernel of that project still exists today in the form of AOL.

>
>It's a shame that we're not all elephants (who never forget)

That's why we have websites like the AHS, Atari Gaming HQ, etc. I'm
looking through some of Atari's patents now, and I'm seeing some
surprisng stuff. They hold a number of patents for joysticks (and the
technology therein), the force-feedback steering wheel (4 patents --
including steering resistance and the gear shift -- resulting from
their Hard Drivin' coin-op), handheld game consoles (specific to
"invertable" ones, meaning the Lynx's ability to flip the display for
southpaws), simultaneous multiplayer, multiplayer coin-op games
(Gauntlet, et al), dual floppy disk machines, and numerous
display-specific patents, including hardware sprites, the method for
colouring polygons, scaling raster images, hardware scrolling,
parallax scrolling, right down to simply displaying moving objects on
screen. Many of these I knew about, but not in such detail.

Ouch! Right up until this point...

>Unfortunately nothing
>was done with 'til 1981 when Xerox used PARC's prototypes to create
>the Xerox Star, from whence all of today's GUIs originate)

True, but it was 1979. Steves Jobs and Woz, and I think Mike M, where
invited to go look at PARC, and the seeds that became the Apple Lisa
were planted. The Lisa was released in 1981.

>The first
>Apple I was released in 1975, and used MOS Technology's 6502

1976. April 1976.

>> Midi (Atari was the
>>first and only computer to incorporate this as standard- forget msx and
>>apples attempt)
>
>Atari didn't pioneer it, but they certainly made it more popular.

And that's only because Apple got sued out of the music business by the
Beatle's 'Apple Corps' brand. Apple also never 'integrated' MIDI, merely
the software, the MSX attempt was a synthesizer on a board that happened
to plug into an MSX computer (The Yamaha CX5M).

>How's that? SIMMs were used long before the STE made use of them.

In 1977, in the form of the Apple Language card :) I think Carmel is
trying to say the modular upgrades of the 800 are the basis for SIMMs

Apple invented plug and play for actual cards, on the Apple][- they
contain a PROM. You can plug a card into any slot and it will work, be
identified correctly, etc.

She certainly can't consider the internal layout of an 800 to be plug
and play. Plug and play means self-configuring cards, not a slot for a
memory card into which a memory card plugs!

>USB's considerably more advanced, though -- and faster. Still, it
>took them bloody long enough to come out with it!

I don't think USB is related to SIO beyond being a datastream. Like you
said, SIO is dependent on a pin identifying the device, whereas USB is
more like AppleTalk or something similar, it's all done in software.

Atari were great - they were true innovators - but I think it would all
have happened eventually regardless of who did it. If Atari hadn't,
perhaps Grandstand would have made a stored program colour console, with
the resulting mistreatment of staff and court case.

Natural progressions of technology.

>

A Pin? The SIO is rudimentary plug and play. Plug and play still requires the products drivers to be loaded (like the SIOs device drivers), and respond to inquiries. SIO just falls short in ASKING 'whos out there?' and configuring automatically. It assumes that since you want to access, say 'Q1:', and the Q: driver is loaded, it must be hooked up, and sends its commands. Of course, if its wrong it times out.

The SIO is serial, not pin related. You know, if you had a RAM based OS, and smarter peripherals, you would send out an inquiry, the peripherals would talk back, and you would load drivers based on that. Hmmm, kinda like USB.

And wasn't one of the designers of the spec for the USB, in on the SIO design also?

Tony

Well, pooey! Would have been neat to get it fixed. I am somewhat interested in this since the 5 1/4" flippies are in low supply in my area (as well as PC board and electrical tape for some dammed reason).

> PS:- Didn't percom in the US come out with a floppy board... I haven't

> (only 90 sterling)

Sounds right. That is IF you could find it. Percom boards were kinda rare if I am not mistaken. Then again, most of the useful weird stuff for the 8bit seems to be in low supply anymore. You have to be dedicated to Atari to find anything and then it is by searching with a fine tooth comb.

While I was fooling around<heh, doing a vantity patent search> I decided to check out the Atari patents. I am sure this will be badly truncated/ww, but you may be able to cut and paste multiple sections.

If you can't get it to go, you can set up a search for the year 1979 with inventors Mayer, Miner, etc.

Kind of cute, a lot of the stuff I speculated on is the way it was done. i.e. variable clock to determine pixel widths, that kind of stuff.

"Alto" was the prototype I mentioned with the GUI, mouse, Ethernet,
etc. But you're right, my mistake; the Altair was a kit computer from
created by Ed Roberts and released through MITS/Pertec. Nevertheless
it was still the first commercially available microprocessor-based
computer to see the light of day. It was also the first computer to
feature a Microsoft product: Microsoft BASIC. (Quite a few machines
that followed also featured Microsoft BASIC as an integral part of the
OS)

>I have seen a couple of these puppies for cheap in surplus stores. Funny how
>when you dead end a product or research, it becomes nothing more then a

Particularily since the Altair actually gained a small but very loyal
following, resulting in several Altair user groups popping up in
California and France (possibly elsewhere, as well).

This is sort of arguable. Xerox released the Star in 1981, but it had
been in development for approximately the same amount of time as the
Lisa, and both were released approximately around the same time. (I
can't find any exact dates, however) Both were based on the PARC Alto
prototype -- though the Lisa's had a weird aspect ratio. (It looked
rather like a sandwich that someone sat on... :-)

True. Mind you I don't think the cards were self-configuring as
such; they merely communicated what they were with the OS, and the OS
acted accordingly.

Generally speaking, probably. Atari were the first, but they were
sensible ideas that likely would have happened anyway. The only
question is when. Still, Atari had the forward thinking and presence
of mind to actually be the first to pioneer the things that they did,
and related technology as a whole exists and is all the more advanced
for it.

5564. Tonight's (Tuesday, 5th September) IRC #Atari8 Weekly Chat

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-05 02:29:18 UTC
From: DCM01@USA.NET
Message-ID: <39b45952.385326@news.CIS.DFN.DE>
Source record: 42241

This announces our weekly IRC chat for Atari 8bit enthusiasts.
It's scheduled for September 5th, 2000, 10:30 pm Eastern US
time.

Here are the corresponding times for some other
places, choose the one near you.

California: 7:30 pm. Colorado 8:30 pm. Texas 9:30 pm.
London, England: 4:30 AM. Berlin: 5:30 AM. Hong Kong:
11:30 AM.

The topic for the chat will be "Printers for the Atari: Setup,
Compatibility, and Drivers"

General Atari8 chat is also welcome. If 7 people show up, I
will provide a doorprize. The doorprize is a like new copy of Preppie
II by Russ Wetmore.

This will be a standard IRC chat. It is not a web-based
chat on your browser. You need an IRC client, such as
mIRC. The chat will be on Amiganet. Here are some
servers that will get you there:

irc.whiterose.net
thule.no.amiganet.org
linux.us.amiganet.org
au, uk, se, no & us.amiganet.org

Once you log onto a server type "/join #atari8" and we
will be there waiting for you I hope!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

I'm sure that wouldn't work. Reason is the timing requirements
which is simply not to fulfill in the windows way of multitasking
as it seems. Here's my experiences when trying nevertheless :
I have a 1050-2-PC which does what the name suggests ;)
I didn't try it under W95 since others reported that it would not
work. First I tried it with NT which was a total failure. After
transfer of about 50 sectors the serial interface hung itself up
each time I tried.
Then I tried W98. This seemed to work and I have been happy for
several weeks until I discovered that sometimes there was a
sector written with wrong data in it (every 5000 sectors or so).
Since W98 has the option to restart in DOS mode I then tried that
and until now I didn't detect any more problem. So this seems the
only reliable way.

Gerhard

5573. Tonight's (Tuesday, 5th September) IRC #Atari8 Weekly Chat

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-05 13:26:06 UTC
From: DCM01@USA.NET
Message-ID: <39b4f469.739931@news.CIS.DFN.DE>
Source record: 42242

This announces our weekly IRC chat for Atari 8bit enthusiasts.
It's scheduled for September 5th, 2000, 10:30 pm Eastern US
time.

Here are the corresponding times for some other
places, choose the one near you.

California: 7:30 pm. Colorado 8:30 pm. Texas 9:30 pm.
London, England: 4:30 AM. Berlin: 5:30 AM. Hong Kong:
11:30 AM.

The topic for the chat will be "Printers for the Atari: Setup,
Compatibility, and Drivers"

General Atari8 chat is also welcome. If 7 people show up, I
will provide a doorprize. The doorprize is a like new copy of Preppie
II by Russ Wetmore.

This will be a standard IRC chat. It is not a web-based
chat on your browser. You need an IRC client, such as
mIRC. The chat will be on Amiganet. Here are some
servers that will get you there:

irc.whiterose.net
thule.no.amiganet.org
linux.us.amiganet.org
au, uk, se, no & us.amiganet.org

Once you log onto a server type "/join #atari8" and we
will be there waiting for you I hope!

You should use it on a fast computer. Supposed to work better with DSR then RI. I ran it to test for ~5 minutes on a 300 mHz AMD K6 II with RI type cable and don't recall any SIO errors.

Diskformer is a program that will also let you do it. You don't need the custom made cable, but you do have to have a standard serial port available on the 8bit side. One way is to use the 850. That's what I do.

Once the 850 is setup you run a nullmodem cable from the PC to the 850. You then run a terminal program on the PC side. Diskformer will take a XModem download from the PC side and write it direct to diskette.

It's not ewasy to set up but the results are worth it.

5576. SIO2PC settings?

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-05 14:31:21 UTC
From: rja <no@spam.please>
Message-ID: <39b503b9$1@rpc1284.daytonoh.ncr.com>
Source record: 42245

I'm trying to get SIO2PC working with my PC and Atari 800xl, but
am having some problems, possibly with the timing settings.

FYI It's an Atari 800xl on the one side, and a AMD K6/3-400 on the
other side. I'm running Windows 98 (though I tried it from both within
Windows and from pure DOS mode).

I can see that there's some communication occurring between the systems
(when I attempt a directory listing on the Atari, I see the status line on
the
SIO2PC program display various changes). But I cannot so far get a
successful directory displayed on the Atari side (and yes, I do have a
virtual disk loaded into SIO2PC when I tried this)...

Any thoughts or suggestions? Particularly, any suggestions as to the
values I should have for the Timing Settings in the SIO2PC program itself?

Any ideas would be greatly appreciated! Thanx...

What kind of sounds do you hear coming out of the Atari when it tries to
boot? Do you get BOOT ERROR or nothing?

Voltages at pins helps too.

Yes, APE '98 works great. Just got a used 130XE and I made a PC2SIO cable using the DSR pin on the PC and everything is working like a charm! I'm not sure about PC hardware requirements but I'm pretty sure it can run on anything that will run Win '98. I use a PII 400 and have no transfer problems.

From: zinniz@my-deja.com
Message-ID: <8p47prus1@nnrp1.deja.com>
Source record: 42149

I used to have an Atari 600xl, and I think it's somewhere in my dad's house languishing. I just played a bunch of atari 2600 games at a friends house over the weekend, and from what I remember, the cartridges look the same, as were many of the games (keep in mind I havn't played 600xl in at least 15 years). I was just wondering if the cartridges are the same, or if they're the same as the 400/800 cartridges. Also, how easily available are the games?

Thanks for the help!

Carrie.

Hey Carrie-
The whole 8bit line is interchangeable. It uses the 400/800 carts, the 2600's don't fit the unit at all. You can find games and appllications on cart and disk on eBay, www.best-electronics-ca.com, or www.myatari.com or any multitiude of Atari dealers on the net.

5585. REQ: for any information about programming the Lynx

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-06 03:41:31 UTC
From: Todd Nathan <todd@palomablanca.net>
Message-ID: <8p4q8sbsi1@news.sdf>
Source record: 42154

Hi,

Been surfing the net, got lots of downloads, know about the Howard
system (not much about what it is, but that it exists and is expensive)
and about emulators (Like Handy/MacOS). I also have an Amiga 2000HD
on order and may use it to develop with a Howard System and a Lynx.
What I really would like to do is this

1. Have a Lynx around.
2. Interface it with a Macintosh G3 B&W and serial cables (or some
type of communications cable).
3. Be able to download programs to the Lynx.
4. Use CodeWarrior MacOS and some type of extension for cc65
(some type of 65C02 C compiler)
5. Make this all work and have docs for the Lynx and its routines.

So, basically I want to use what I have now, a Mac B&W and tools
that I have (CW and MPW, preferrably CW) and develope and download
games to the Lynx.

Any thoughts, ideas or the like on how you have done Lynx Programming
in the past are more than welcome and helpful.

Thanks!

5586. Re: Sega Gamepads and the Atari

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-06 05:14:13 UTC
From: etom000001@aol.com
Message-ID: <20000906011413.29830.00000267@ng-fz1.aol.com>
Source record: 42155

Well, when I used a Sega 6-button game pad, the only problem I had occurred when I unplugged it from my Atari 800 while it was on. Defender froze. So, I think the Atari 800 is pretty durable, but keep in mind that equipment not specially designed for the Atari should be used cautiously.

Studying the pinouts between a regular Atari joystick and the Sega 6-button game pad reveals the use of a +5 V pin. I think the Atari actually sends out the +5 V signal, so the game pad should not be unplugged while the power is on.

[Please read - Buyer Beware] Digital Data Factory (Edward Williams)

To the Atari community,

It is with a heavy heart that I give the following message. I normally like to stay fairly upbeat in my writings, but I feel it neccessary to warn many good Atari hobbyists and users of a wolf in lamb's clothing in our midst. This message comes after 16 months of broken appointments, and broken promises reguarding an agreement on an Atari item.

It was over a year ago that Edward Williams was accused by someone on the Atari 8-bit newsgroup of being little more than a thief. I stood up to defend his honor since he was a fellow member of AUNT, and a long time Atari associate from back when I was into Atari the first time around back in the 80's. I must now sadly apologize for my stance on his behalf.

Information on this individual is as follows:

Digital Data Factory (Edward Williams) 200 Crestview Dr Apt 62
Jacksonville AR 72076-4068
USA
(501) 985-2082
Used hardware
Repair Shop.

(This information found online at...)
http://www.faqs.org/faqs/atari-8-bit/vendev/

Mr. Williams was notified on August 3rd that this message would be sent to all Atari channels if he did not return the Atari item we had agreed on for him to work on. Naturally a few additional days were given to allow for labour day and the postal delivery day in case he sent it by mail.
And as said before, the firm deadline I placed came after 16 months of many arrangements made, missed appointments, packages that were promised on being shipped, you know the drill.

I have been an Atari hobbyist and trader since November of 1998. Made many transactions, met many people. I like to fulfill my trading transactions with quickness and efficiency. When I came back from my nine year absence from Atari computing, it was good to see a familiar face like Ed's. He and I go way back. It was fun hanging with him and AUNT. His actions seemed sincere enough then. I'll remember that part fondly.
But for some reason he has chosen not honor his deal with me, and from what I've seen I am not the first.

I hope that my actions on the newsgroups are respectable enough that you will know I would not post this without just cause.

My thanks to the other good folk here that make this hobby such a blast. It is for your sake that this letter was written.

Sincerely,

Greg Goodwin aka "Doctor Clu"

APE '98 is a little more complicated to use than SIO2PC, I think you have the correct interface. Don't adjust your computer, I have an AMD Athlon processor in mine and the one time that I did tinker with it, it worked. I am not that big of a fan of SIO2PC since my 800 is on the other side of the house :) so dragging it in here is not the easiest job to do. Then you turn around the tower to get the the back ports...

I have had the same problem with the gamepad and the ST mouse. Just be careful not to unplug it so abruptly.

You may be asking why I use the ST mouse. I use it for drawing and other similar applications, for graphics that require a lot of strokes that my hand is not in the mood to make.

Check the cable on the PC end. In Ape '98 under configuration you have the selection of choosing the pinout of the cable (RI or DSR I think). Make sure you have the right on selected or it won't work. If your cable worked fine with SIO2PC software than the pin is most likely RI. Hope this helps.

I think your win98 paint will allow you to reduce the size of your .bmp files. I've done it, but with win95 paint. Load the picture. Then under 'Image' choose 'stretch/skew' and specify height, then width.

This is a little off topic, but since it involves Atari files (and hopefully someone else can benefit from the info...)

I have some Atari picture files that I d/l'd from the 'net. Unfortunately, they are too big to print on standard paper, so I need to reduce them. Is there a good W95/98 based program that anyone has used that would allow me to "shrink" the size, and maybe convert from one format to another? W98 "Paint" won't allow me to do that, so hopefully there is something else.

Thanks,
Larry

IMO: Run an emulator and just take a screen shot. Easiest way is to just hit the Print Screen key, but there may be something like <shift> in there.

Once you hit the PS key, then tab/start menu into paint. I think you have to do a juggle or two, like choose "Name", "Edit" and "Paste", but it should work.

Microsoft Imaging or that other paint program that comes with 98/ME
will work, too. Or for that matter, download Paintshop Pro from
winfiles.com ... you can resample the image to a specified size
(either by pixels or inches).

Ugh... after much tinkering my 1027 refuses to work. It turns on, the wheel spins, everything it should but it refuses to print a page. Have tried many methods, hooked up to an 850, used with an I/O saver, used a different I/O cable, fed it directly to the 800... Seems as though the printer is having trouble recieving data. Any way to fix this (and yes, I have dropped it many a times lately).

IIRC: They are a nice parts source. They are similar to a 1050 bit built a bit stronger. I don't remember the exact parts, but seem to recall a 6502, ROM/RAM<?>, 6522, well built internal 5V and 12V power supply.

I bought one just to for the power supply/case to make myself a CD player.

5614. diskettes for Atari 800

I'm running out of blank disks... is it possible to buy new floppy diskettes to use in the old Atari 800 drives, or is there a diskette currently on the market that can be formatted by, and work properly, in these old drives?

I've not seen any avalible new, Best bet it look for Soft Sectored Double Density disks

I've had a bit of luck with a local 2nd hand PC overhaul place in getting 25 disks of this type and i have been able to use them without problems on my 810 and 1050..

the 1.2mb disks are hard sectored and can't be formatted corectly for our use.

any sources out there?

(Mindfield points out that Paint does something when reducing that
doesn't look so good.)
That's true. The pictures I've reduced with paint really look grainy or
something. I'm betting Paintshop Pro or Photoshop or some other
picture program would do a better job on reducing the size of the
picture and the finished product looking good.
Russg

>Thanks again,
>Larry

Bear in mind that Paint does simple pixture stripping to shrink the
size. Paintshop Pro will actually resample the image, then apply an
antialias filter to smooth out the rough edges. The end result is
much easier on the eyes.

I use Photoshop for most things, but I like Paintshop Pro for simple
image editing that doesn't require the long load times of Photoshop.
I also like it for screen captures. I've stuck with version 4 tho...
it loads fast, doesn't have all the frills of 5 & 6 (which I use
Photoshop for anyway) and it works nicely.

Yea, I have to agree. Any type of bmp creater tends to do that. Just don't convert anything to a .gif, it looks pitifull.

5631. URGENT! Bay Area: Really cheap Atari 800 + mucho peripherals, software

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-08 02:13:15 UTC
From: sej@aol.com
Message-ID: <20000907221315.14351.00000182@ng-co1.aol.com>
Source record: 42100

Dear 8 Bit Loyalists:

For the last year, I've been hoping to thoroughly test and inventory my old Atari system, so I could auction it off for a good price.

I've decided I really don't have the time or energy to do that, and just want to get it to a good home.

I'm asking $20. I'd just give it away, but I actually have been buying Atari software over the last year, at thrift stores. I'd like to get THAT money back! :-)

Also . . . you have to pick it up at my Pennisula apartment before 9/14/2000.

THAT'S NEXT THURSDAY.

I need it out by then because I want to get my carpet cleaned, and have family visiting from back East.

Here's what the package has:

* Atari 800, 48k, with GTIA chip. Power supply. (Works fine.)
* 850 interface with power supply. (Not tested recently.)
* 1020 color printer. In box. Extra pens, but no manual or software. (It powered up, and did its little pen check, but I didn't remember how to test it!)
* 810 drive and power supply. Booted and formatted a disk.
* 1050 drive and power supply. Booted and formatted a disk.
* 300 baud modem, in box, with cart. (later model). (Untested)
* Hayes 1200 baud modem, with power supply. With home-made serial cable!
* 410 recorder. (Didn't seem to work . . . motor hummed, but wheels didn't turn. May need lubrication.)
* 1027 printer and power supply. (Powered up, but the print head fell to pieces. Good for parts?)
* Lots of cables.
* Lots of joysticks. (At least four)
* Paddle controllers. (Two sets?)
* Trackball controller.
* Atari Lab starter set, with temperature probe.
* Digital Vision ComputerEyes video digitizer, plus software.

SOFTWARE
Oh, cripes. Too much to list. Lots of boxed Atari software. Spanish and English lessons on tape. Lots of carts. A few cassettes. A few APX sets, including the Eastern Front source code. Macro Assembler; Assembler Editor; Introduction to Programming.

AND
Some BASIC books. A stack of Analog and other Atari magazines. Assembly Language book. 1978 vintage Atari catalog. 1988 vintage Long Island user group newsletters.

AND
All the 5.25" floppy disks you want. I transferred all my old PC data to CD-R.

AND
Somewhere in my storage area is a binder full of manuals and such. I'll dig this out and send it to the buyer, eventually!

Best,

Stefan

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/

Not Just Games! To find NEW Items, search my Catalogs/Text files for the text "+NEW in BOX" or sometimes "+NEW in BAG"! While your Looking, check out my +NEW in BOX HardWare as well as some not so new HardWare, SoftWare, Books & Accessories for Your Classic Atari 8 Bit Computer, 64 Bit Atari Jaguar Game Machine and the Atari ST and Newer Computer Line! Act fast! Sale ends without !WARNING! To take advantage of my Insanity! (I'm a Manic Depressive)! Thank You for Laughing at my emotional scars! Get New Catalogs, Request them in E-Mail or Download from my WebSite! So for my Free Atari catalogs read on!

e-mail: atari@benjamin.net

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump to my FTP site linked to my WebSite so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor & view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want to order and E-Mail me the rest of what you do want to order! To expedite things, include your complete Mailing address so I can figure Shipping/Postage and Handling. I'll be back after the weekend.

So if you don't come see me, I can't save you any money! ;-(

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/
Web info in my Signature attached to the bottom of any of my messages!

While agreeing that Bruce Lee is the better game (I played it till my wrists ached just a few weeks ago) I have to stand up for Conan too. I still have fond memories of the rhythm of the...what was it, dragons? The level where several different creatures are all the same noise at a slightly different tempo, so the drift pattern took several seconds to repeat.

Hello!

I've recently bought 7800 - PAL version. What will happen if I order the games from O'Shea - most probably american carts so that they should be assumed NTSC. If they are not PAL enabled they should be slower. But I didn't seen anything on the boxes or carts about differences between PAL and NTSC.

Question is: Are there any differences?

You might look at
http://www.mei-microcenter.com/

They have brand-name and bulk 5-1/4's.
I purchased some bulk from them, but did not like them. They were of fine quality as regards the media, but lacked center hub reinforcement rings. I also bought one box of everything they had to try, and overall (price and quality), Verbatim was #1 IMO.
MEI was fine to deal with. In Atlanta, I believe.

Usually the only way to know is to open the box or find a small warning on the box saying "For NTSC Consoles only, do not use on PAL machines," or something to that extent.

Message-ID: <39B8E2D8.147C60E0@shodor.org>
Source record: 42121

The father of a friend just retired after 35 years of teaching. He would like to compile his notes and experiences into a kind of memoir. Problem: the first 25 years of notes were all created on an Atari using ATARIWRITER. He would like to find someone who can read 5 1/4" disks in this format, and copy the files into some newer format he can use with the Windows machine he was given as a retirement present.

Help! Does anyone know of someone who could help me help this person?

Well, for starters, check with OfficeMax, Staples, Office Depot, or any other office supply store (even your local office supply store). If any of these stores don't have 800K disks in stock, they can special order them for you. The big "discount" mega-stores like OfficeMax will usually even give you a percentage discount off the catalog list price when you place a special order.

Try these places:
www.dartek.com - 1-800-832-7835
www.globalcomputer.com 1-800-845-6225
www.mediasourceinc.com Media Source - 1-800-241-8857

There aren't too many mfrs of these disks, but Imation, which is good brand, still makes them.

Star Trek by AI? YOU HAVE IT? I have been searching high. I have been searching LOW... We have the old cassette tucked away somewhere, but I haven't seen it in YEARS.

I hate to sound greedy, but, ICQ? Alt.binaries.comp.atari8bit? This, Sands of Mars (Crystalware), and one other basic game, the name of which eludes me, have I been spanning the globe for! The 3rd is a BASIC graphics adventure set in a castle. The first order of business was to get into the castle. It MIGHT have been Crystalware's Clamus Castle (or something like that), but I don't think so. It MAY have been called "Warlock" or something similar.

I can be reached at kraygien@hotmail.com , attachments to text messages are welcome... :)

Clu,

BTW, if there's anything you might be looking for - let me know... I don't have information on where to find a lot of "hard to finds," but I'd be happy to look through what I have...

On the boxes ? Checked three games, none said anything else than for use on 7800 systems. But my PAL carts have a "P" sticker on the cart itself. But, then you need to open the box to see of course.

You'll probably be interested to hear that the article on
vintage Atari (and other) computers from the Dallas newspaper was
reprinted in our the Erie Morning News on 9/5. Nice article. Glad I got a
chance to see it!

It was also run in the Fresno Bee this past weekend with a big color picture of Greg Goodwin (Dr. Clu). Congratulations Greg you're a celebrity. (of course the headline refered to our kind as "Techno Geeks")

(5 1/4 disks)
(Gees? Larry White?)
somebody said they got 5 1/4 disk without the hub ring.
Normally, if not only, that means they are high density 1.2 meg disks,
which are unusable on an Atari 8-bit. 360k double density disks
have the hub ring. AFAIK no hub ring, high density.

I wrote a silly little program in BASIC to make typing all that stuff in a LITTLE easier... I would type in the data lines by keeping my fingers on the secondary home row (the number row), and instead of using the comma to separate values, I'd use the space bar, so I wouldn't have to keep moving my fingers around. My little program would add the commas in later. You know, it was a silly little program that saved a LOT of time! I should have put it on the market .. I'd be RICH today! :)

Perhaps you should have. The millions of Atari hobbiests from the 80's, and well, today, would appreciate it. Of course, you would have been outstaged by someone else trying to make a better version. So many programs have become obsolete because of that, Atari DOS for SpartaDos and MyDos, etc, etc...

But I just went to their site, and it looks like they have stopped carrying
brand name disks, also. (Rats!) Just bulk!

I'm going to do some looking, and will post the results.

True enough that HD do not have hub rings (I have never seen one, at least). But some DD also do not have hub rings. As I write this, I am looking at a DS/DD Imation (3M) 5-1/4" with no hub ring. These aren't old, either. Boxed, unformatted.
Saves at least 0.1 cents, I presume. :-)

Yeah perhaps so. I'm SURE it would have been outdone, as you say, though...
It was a VERY simple program .. The IDEA is what would have "sold,"
probably. I never really did see anything else like it, simple or
otherwise. And now my poor Atari setup sits in a box... I'd really like to
hook it up to the PC with one of these cables everyone talks about, but I'm
not very mechanically inclined, unfortunately. I suppose it's just a matter
of sitting down and MAKING the time to do it...

Speaking of typing in those programs... You know, I don't think I EVER got
a single one of them to work properly. Most of them would mainly work, with
a few problems. Thinking about this reminds me of the list of errors in the
DATA lines they would publish in the next few magazines. There was very
little more depressing than spending DAYS typing in a program and GOING OVER
IT AGAIN because it didn't work only to find the reason it didn't work was
due to a misprint!

Poor Atari setup... I can understand not having the time or the inclination to hook it up to the PC, I need like an 80' cable to do it (the 800 is on the other side of the house but if I could just drill a hole through the wall I am sharing with my bedroom it would work. No can do, have a strict landlady :().

Yes, and additions and edits to the code that a reader would discover and then EVERYONE had to try it. The only type ins I ever got to work were some out of Compute's "books of Atari" and those were originally printed in the mag, so who knows what types of glitches you could run into.

My arsenal of 3M disks from about 1989 (found at goodwill @ $1 a box, shrinkwrapped and still havd the price tages from Costco or wherever) do not have hub rings. They are DS, DD and soft sectored.

As for your comment about the hub rings, hey, they save a whole penny a box. Hot damn! I got me a penny, guess I could go buy me a piece of Bazooka Joe...haha

Depends on the image. If it doesn't have that many colours, GIF will
work fine. (GIF images only support an 8-bit palette, or 256 colours.
Their only real advantrage is that you can animate GIFs. BMPs can be
"animated" through colour cycling, but it's pretty lame... the default
bootscreen to Windows 9x uses this to simulate that moving blue
gradiated bar at the bottom)

The disks might be gone from the catalog, but the stores (MicroCenter) still carry a few. They're not bulk disks. They are name-brand and in boxes, but you have to look very carefully for them. In the store near me, for example, there was a plethora of 3.5", high density disks and Zip disks. OTOH, there were very few SuperDisks, and just a few 5.25" disks. Of those, most were HD. The HD and DD were the same brand, and the pacages looked very similar. So read carefully!

don't have a 400. But maybe you're hooking a RF cable into A/V
input ports on the TV. If the 400 has monitor output port, that'd be
the one to hook to the A/V of the TV. If it is a RF cable, you'd hook
that to the antenna input, not the AV input.

OK. Apparently some DD 5 1/4 come without the hub ring.
I believe most do have the hub ring. Now, how about the obverse,
can we at least say if it has a hub ring it is DD for sure? It is probably
safer, given an unknown 5 1/4" disk in your hand, that if it doesn't
have a hub ring, it probably isn't DD, if it has a hub ring, it almost
certainly is DD.

>it was a silly little program that saved a LOT of time! I should have put
>it on the market .. I'd be RICH today! :)

You might have sold it to one of the magazines of the period.

Antic published "Typer's Tool Box" in '83 or very early '84 which would do a lot of the housekeeping for you including automatic line numbering and a special data mode. The data mode added the "DATA " and the commas. Also, A.N.A.L.O.G. printed a pseudo key pad which re-assigned the letters below the "7 8 9" to give "4 5 6" and the next row for "1 2 3". When these were combined, you could do decimal data statements all with the right land and follow your place in the magazine with your left. Later we even built the check-sum algorithm into the code. Basically we never left any code as is; always added something or tweaked it a little to "improve" it. PC's were really personal in those days when you could write a lot of your own aps with a little help from some borrowed hacks.

Source record: 42032

Hi,
You need a r/f switch (also known as a tv/computer switch from the days when it was needed to hook up a computer to a television set) which would be available at radio shack for a couple of dollars. If it still has the two screw in ports (like for an antenna) you may need an ohm converter which will allow the prongs to screw in and go into your cable input jack.

As for the channel, make sure you have it set on 2 or 3 to pick up the signal, you can change it by using the little black switch marked "channel 2-3" next to the on/off button. Let me know if you need more help (like periphial sequence, etc if you intend to buy a diskdrive).

I feel that you made a good choice in giving the 400 to your son; if the keyboard is unaltered (still membrane as opposed to having a "real" keyboard), it is virtually kidproof. Using a joystick also improves the fine motor skills in a child's hand (I am assuming you are giving him some games as well) as well as hand-eye coordination.

Don't feel bad about not knowing, I was pretty dumb about certain things when I first got my 800; I was a nintendo user in the 80's and had no idea about the switch. Best of luck,

Hi,

I have had a much similar problem with A800Win, not on Shattered alliance, but on various other programs. Are you sure that you have a full download of it? I have found that I would get partial downloads if I was not careful while downloading .ATR's, etc. The only way I have found to get it to stop doing that is to restart the program mid operation. You may have a systemwide crash and get the bluescreen of death, or it will up and decide to work. Don't ask how. I have come to the conclusion that my PC is a semi organic lifeform that really really hates me...

Hi Amiga Man,

My suggestion would be to put it up for auction on eBay and see what it goes for. If you post on the newsgroup here and start the bid out reasonably, the public will usually determine the price. Sometimes you may be suprised at what some people will pay for this stuff. The A8000 is a neat little box and in demand at the moment and you should be able to get about what it is worth if not more. Just try it (if you like) and let us know when you post it.

Hi Nathan,

There are several out there. I would reccomend getting Atari800Win (freeware) and going around to several of the emulation sites and looking for Star Raiders. However, we have all complained about color differences in the emulation, like the shields are green on some units as opposed to blue, etc. One of us may be able to send you a copy by eMail if you download A800Win.

The emulation is not perfect but it is the closest you can get on the PC without buying one of those "Over 1000 Atari Games, only 1 cent" CD-RW's on eBay (and if you get to purchase it without eBay closing it down. SafeHarbor has been known to close auctions of this type due to copywright infringements).

Good luck on your quest.

Wll, it looks like I'm not the ONLY one who came up with that idea!
Figures... :) As I recall, my little program also added "DATA" in so your
fingers never had to leave the number row. I never did even think of the
pseudo key pad idea, though... We read A.N.A.L.O.G. and many of the other
Atari magazines of the time, but I don't recall seeing either of those
programs at all. I'm SURE we'd have taken the time to type them in if we
had!

I know what you mean about writing your own apps with some borrowed hacks...
It seems most of the programming tricks and techniques we learned weren't
from books, but rather, from other programs people had written, including
those in magazines. One of the tricks I learned, however, haunts me to this
day. I wrote a disk labeler program (a real nice one, if I do say so
myself) and used one of these "tricks" to disable the break key, and make it
so the program couldn't be LISTed. It seems like I saw, at one point, a way
to get around this using various POKEs and the like, but I don't know where
it was and never wrote it down or used it anywhere; I thought I had kept a
LISTable copy of my program. I hadn't, however, and I have no print-out or
anything of the "code" of my basic program. In addition, for some silly
reason, the first thing I had the program do was to make sure a printer was
hooked up. If a printer wasn't hooked up an error would show, and you
couldn't continue w/o hooking up a printer. So, not only can I read over
the code, I also can't even run the program (no printer) to bring back old
memories or anything! Ack!

Get an 8-bit emulator such as Atari800 (for DOS or Windows), or
XL-It!. Those two are the best around at the moment. You can get
either at www.vintagegaming.com or www.classicgaming.com. I also run
an FTP featuring an Atari section that borders on immense. (I was an
Atarian for about 14 years, from the 2600 on up through the ST line,
so naturally this is my specialty. :-) I've got the major
emulators, as well as disk images and single files for very nearly all
8-bit Atari programs.

The colour differences are not emulation problems as such..They are TV
problems.

What you see as blue WAS meant to be green I believe.

Blame either countries TV systems (UK /US)

I never get to the load roms problem. Mine just says it's failed loading Atri800win because there is an error in Atarti800win.exe. Then your only choice is to close which closes the half open window in the background. Does it generate a ini or log file? If it does maybe you could send me it. As far as the ROM problem it may need to have the path changed manually in the register.

The colour differences are not emulation problems as such..They are TV
problems.

What you see as blue WAS meant to be green I believe.

Blame either countries TV systems (UK /US)

Yeah I've got an SBLive, DX7 latest version, etc. An older version worked fine but the last few releases have caused this. Even after doing a brand new Win 98 install it still did this. Like I said maybe if I had an ini file that it creates (if it does) then I could get it going. I've looked in the registry and all paths etc seem correct.

Removed the registry settings key (although I think that option is
built in the later editions)

If it's dying before it can fully launch the program then it's a bit
weird.

Try deleting the reg key anyway..It won't do any harm as long as you
only delete THAT key :-)

If not then try the link I sent for the older versions in the
newsgroup.

Your problem is different than mine. I did have this problem when I renamed the folder as the registry had the original name. So I went to the registry and corrected the path names then it found the roms.

I went to Holmes page and got the Unofficial release version 2.5e and that one WORKS!!. It is the only one that does though. versions 2.5c and whatever the third one is on Holmes page both don't work. So at least it now works. Strange that the latest don't though.
I tried Rainbow and that works but it seems to be shareware and though I do buy shareware I am not going to lash out money on an Atari 800 shareware program if it's no better than the freeware ones around.

Nothing really new or provocative, just a list of names and games.

The funny thing is after reading the games and producers of the copyright infringers, I almost felt like looking them up and seeing if I could buy their games. Probably the exact opposite result Hasbro was looking for.

I am having difficulty with the sound in 2.5c. The sound is worse, but I don't really know how to explain what it sounds like. It doesn't sound right, first of all. The two "clicks" known to all Atarians when you first boot are elongated, and almost get a type of an "echo" to them, or better, they aren't just two simple clicks, but rather a set of clicks. It almost sounds like a short in a speaker or something. At one point the program actually shut off the sound because of a problem it was encoutering, I guess. I backed up to version 2.6a and have no problems with that version...

I'm using a SB AWE64 16 bit sound card on a 300 MHz P2 under Win 98 SE.

Even though that Atari 400 fits your A/V input perfectly, that's not where it goes. On newer TVs, it would have to connect with your cable TV input, which, of course, uses a different connection. :)
For best picture and sound quality, use a simple adapter that they sell at Radio Shack that allows you to connect directly to the cable TV input. It makes it messy to change back and forth for regular TV viewing, but those switch boxes can really degrade the picture and sound.

Something I just did that MIGHT be related... I upgraged to 2.6c a few days ago, and due to sound problems just visited Holmes to pick up an earlier version. I tried 2.6a, and it seemed to work just fine, at first. But, when I switched the hardware from atariosb to the atarixl ROM, the XL ROM would not load. I recieved an error telling me so, along with a box which asked if I wanted to view the error log. Every time I clicked on cancel (as in: no I don't want to view the log) my entire system froze up. I went through the same steps several times (with several reboots) before finding out that if I clicked on OK to view the log, my system didn't freeze up, and Atari800Win allowed me to change options. I went in and looked at the paths for the ROMs, and they were all correct. BUT, I still couldn't load them. I actually went into the window where it shows the pathway to each ROM for each individual machine, and used the browse button to point the program to the path and file which was already displayed in the box (which is the path for the ROM files on my computer). After I did this for each ROM, I have had no problems loading the ROMs with the program. Everything works fine now, in version 2.6a. Kind of weird, and I don't quite get it, but at least it works now! I guess it's a bug or sumthin'.

Ok, I don't get it (yours and Paul's response). I've been around this group a long time, but sometimes read it infrequently, so I must have missed an in-joke or something. What is it?

Just to note, I wasn't complaining. I don't care that the screen turns green in emulators; the game still plays the same. But it isn't a TV problem, as was previously stated - the emulation is clearly wrong. Or am I making this funnier by saying all this? ;)

Whatever happened to the Good Ol' Days (tm) when knock-offs of hit games were commonplace and not much thought of by the gaming companies. Oh sure, there was Atari sueing Sierra over Jawbreaker occasionally, but mostly everyone recognized the superiority of the originals, while still admiring the skill of the clone artists. Hey, there's no better programming exercise than to try and simulate a game that's already been made. :)

I just stumbled on this in the auction section of atari.net. Some guy is apparently auctioning off a proto of the 8-bit version of MIDI-Maze. The auction has one day left with no bidders... I'd go for it myself, but all my 8-bit stuff is, sadly, packed up.

Has anyone here ever played the 8-bit version?

Re the injoke Mike...

I'm saying in my bit that the colour is whatever the countries TV
shows and you said 'No', in my US version it say's it's blue..

Maybe on a US TV its showed blue and that's why they said so :-)

I see where my comment was funny in the context of responding to your comment. ;) What I actually meant to say was, at least in the US version *of the software*, not in regards to US TVs. I don't even know if there is a UK version of the software, but does it generally display as green on UK TVs?

Anyway, the software intends to display blue. Anyone care to argue that? ;)

Mike

I have older versions from, I think, 2.4 or earlier. (Just too lazy
to delete 'em. :-) Anyhow, I run WinME and have had no problems.
FWIW, I believe the sound problems are related to DX7 rather than
WinME specifically. I've had sound problems (stuttering, especially
during disk access) with 98 and ME ever since I installed DX7; a lot
of people have complained about DX7 too, saying it's just a big pile
o' crap.

>occoured in Atari800Win, press enter to continue or ESC to abort." In other words,
>the blue screen of death.
>
>LykeWyse

A few possibilities.

1) It thinks there's is a cartrige ROM set to load in the
configuration, and that ROM is either not there, or corrupted.
2) Like 1), but with system ROMs.
3) It's failing on DirectSound or DirectDraw initialisation.

Solutions:

1 or 2) Delete all registry entries relating to Atari800Win. To do
this, perform the following steps:

A) Start->Run, enter REGEDIT
B) Delete the key located at HKEY_CURRENT_USER\Software\Atari800Win
(Click on the Atari800Win key and hit DELETE, then click YES)

Now, reload Atari800Win; it should load with all default options, and
you can reconfigure it from there.

Oh, and if you want zip support, make sure ZLIB.DLL is located the
Atari800Win directory. ZLIB.DLL can be found in the distribution
packages of earlier versions of Atari800Win.

For 3), either make sure you are running the latest version of DirectX
(DirectX 7.0a). If you already are, try re-installing it. If that
fails, try reverting to an earlier version and seeing if that helps.
If THAT fails, make sure you have all the most recently updated
drivers for your video and sound cards. (Unlikely that this is
causing a problem, but you never know)

That was the KC Munchkin suit. But I think that all started way back
in the days of pong when Atari was sued by Magnavox (I think it was
them) for their ripoff of Magnavox's version of Pong (which DID come
first, but Atari's was more successful) and as a result, Atari had to
pay them royalties for every unit they sold, either through themselves
or Sears. I guess Atari held a grudge... :-)

>I'm using a SB AWE64 16 bit sound card on a 300 MHz P2 under Win 98 SE.

IIRC, Atari800Win versions post-2.6a use the DX7 DirectSound library,
and most people widely regard DX7 as utter crap, so I think the
problem isn't so much with Richard's emulator, but rather the
DirectSound library in DirectX 7.

I'm missing Gork's post on this. Seems the reply came before the post.
I wrote a program to list 'unlistable' .BAS programs.
Jindrich Kubec has one on his site that runs on a pc, I think.
(http://www.asw.cz/~kubecj/asoft.htm) He says his programs aren't
on the site or something, so I don't know if it is just shown or what.
If you send me an unlistable, I'll see if I can list it for you.
My program is for the A8, and I don't think it works on emulators.

(snip)
There are no POKEs to undo the common method of altering the variable name
table and a line length pointer because those are LOADed with the program and
BASIC can't get to immediate mode after the LOAD because it can't locate the
end of the statement table and locks.

I had a utility which could fix many of those unLISTables around somewhere, but
I usually just fix it with a sector editor like Disk Tool and a little manual
disassembly of the BASIC tokens.

If you really want to access it, just e-mail me the .BAS file or an .ATR/.XFD
with it, or contact me for a mailing address; 99% probability we can unlock it.

I have a 5.25" floppy disk that goes to my COMMODORE 64, I've had it
for YEARS now, and I just now (I can't believe it) noticed that the B-
side of the disk says FOR USE ON THE ATARI HOME COMPUTER SYSTEM.

can anyone give me some info on this? I've never seen the atari home
computer unit, but I believe it was the Atari 800 system (I remember
using one in school "back in the day"). Are they available anywhere?
Also, where can I find the disks for them? This disk is damaged
(stepped on it one night - dammit!) so I'd like to find a working copy.

Thanks!

Yup. I wasn't sure weather or not the ltd was supposed to be there. Got
lazy and didn't verify with my browser. Hit the correct URL to get many
of those games new in box for less than SMS's minimum bids. Please note
that I corrected the URL in the quote of my previous, erronous post to
reduce any further confusion.

Hey! So you are interested in the Atari...

Well, try eBay first of all for anything.

****

The Atari home coputer system covered the following computers:

400
800
600XL
800XL
1200XL
1400XL
65 XE
130 XE

****
Periphials (long List):

Disk Drives:
810
1050
XF551
(and more by percom, indus, etc.)

Program Recorders:
410
1010

Interface Module:
850

Printers:
820
1020
1025
1027...
...or any Epson-Compatible

Modems:
830
835 direct connect
1030...
...any modem when using the 850 interface (the most economical would be a
14.4 as the 850 maxes out at 9600 baud)

Of course, there are all those extras as well, Koala pad, numerial keypad,
etc...

****

eBay has a special section for all things Atari, including all the gamers.
Just go under Computers-Games-Atari-Sysetms and Accessories and you will
find several computers up for bids. If you are wanting to be really
nostalgic (seeing that your disk reffered to the "Atari Home Computer
System", as the 400/800 line was reffered to at the time) I would suggest a
400/800. Any of the computers will suit your needs.

As far as games/applications go, I would try eBay first but if you are
looking for specific titles you cannot find anywhere else, try the
following websites *(also chock full of hardware):

B&C ComputerVisions:
http://www.myatari.com

Best Electronics
http://www.best-electronics-ca.com

Video 61 and Atari Sales
http://www.atarisales.com

If you have any further questions, please contact me at
mailto:beadsandbangles@earthlink.net
I sort of specialize in helping newbies with questions and hardware
problems as I was sort of stuck in the naieve ages myself so do not
hesitate to contact me if need be.

Thanks,
LykeWyse

Greetings!

I have a variety of Atari programming books currently available on
eBay. They can be found at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?MfcISAPICommand=ViewListedItems&userid=divageek

Some of the titles include:

* Dr. C. Wacko's Miracle Guide to Designing and Programming Your Own
Atari Computer Arcade Games
* Basic Atari BASIC
* De Re Atari - A Guide to Effective Programming
* Machine Language for Beginners

All auctions end Friday, September 15th.

Thanks!

It cannot be the tv. I have tried the same cart in an Ntsc and PAL
computer on the same tv. One was blue, the other is green. It is
either the chipset, or a feature of the program (there is a pal flag
in gtia). I was using the A/V out for the test. Maybe it has
something to do with the encoding of the a/v signal.

Just as a test (not sure if it will work) place a PAL gtia in place of
an NTSC one and see what happens.

Thanks for the info!

I've been an avid commodore and atari fan for a long time now, but I
really focused more on the C64 than I did on the atari (Until now, all
I had in the way of Atari was the ill-fated 5200).

I'm also looking to get out of the C64 line and i'm *trying* to unload
my system(s) plus software. Know of anywhere I can sell this stuff
besides the CBM newsgroup and eBay? I don't have a credit card to use
on ebay and the CBM people don't seem too interested.

Thanks :-D

Awesome!! So in the reprinted articles do you get a good view of the
Atari 800 in the background and the big pictures of the Jaguar and Commodore
64?

I'm just glad this article is getting good circulation. Unfortunately I
have not heard from as many people in Eire, New Jersey, and Fresno, but maybe
this will help stir some interest in some folks out there to dust off the Atari
machinery and have some fun with it. I know of a few who have gotton Atari
fever since. :)

That right there is the coolest part!

Yo! Jessica, How's the Atari thang going, Keep those Atari's Humming

Anyway Re: Hasbro's Lawsuit Jobbie
What about Atari suing CBM over Jelly Monsters, or MS's rip of from Atari's SIO system (namely USB)
And Lest we forget, Atari after all pioneered Custom Designed H/W (the modern day equiv. being graphics/sound cards) and also pioneered the concept of plug and play, not not forgetting Plug in memory modules (modern day equiv. being SIMMs, DIPPs & DIMMs)
I seem to remember Lotus suing some s/w outfit over "the look and feel" of Lotus 123, perhaps this COULD apply to Atari's situation

Happy Atari'ng

FamilyNet HQ: Telnet:\\www.family-bbs.net

August 17th the Dallas Morning News readers found an Atari Jaguar on the front page of the newspaper with an article to go with it entitled "Megabytes of Memories". (That's the recap for those that may have been doing something else that week).

Since then we have heard of it being published in New Jersey, Eire, and Fresno. Unless I hear of any other sightings, this will probably be the last message on this, and you're about to find out why. I've hit a dead end... at least for now.

Remember that news article redistributing service I mentioned in the last posting about this? One called Knight Ridder? I managed to find out a little bit about them at:

http://www.kri.com/

Well, I have confirmed that they were the ones that redistributed the article out onto a news wire. I called up their business office about it, found out they sent it out on August 30th on the wire. I then asked which newspapers had picked up the article to which they answered, "With all the customers we have there is no way of telling."

Come to find out they have 350 customers. Each customer could represent a newspaper or some other sort of publication. All customers combined have a total POSSIBLE readership of 35 million people.

(Kewl!)

The gent at Knight Ridder mentioned that the customers that took the article off the wire on August 30th might sit on the article for a timely released (aka "nothing else to publish/space filler") :) and that about a month or so a person could do a search in the "Lexus Nexus" and find pings on various newspapers that published the article.

When asking what the "Lexus Nexus" was, he said he didn't know, since it was it's own entity in itself, and that such a search would be costly.

Of course my curiousity might make it worth the cost. :)

Anyway, just news that the ole cat (Jaguar) has left some paw prints in publications across the country. ;) (Along with GameFan and other publications)

With all this and everything else going on with the Jag and Nuon, this is a great time to be a Jag fan!

Truly,

Greg Goodwin / Doctor Clu

Thank you BOTH! I appreciate the offer of help and have saved your
messages. I just moved into a new place and don't have a setup in place to
fire up the Atari. I also don't have a modem for the Atari, and don't have
a way to get my programs over to the PC. I hear about the SIO2PC (?) cable
everyone talks about, but I'm just not very mechanically inclined that way.
I've tried, a little, to look for someone who sells a package with a cable
and some software that will work FOR SURE, but until I find something
comfortable I'm kinda' stuck. I'm HOPING I'll get off my tuft and get
SOMETHING set up so I can hook up the 'ole XL to my PC though.

In reading some of the other posts (mainly from YOU! :)) in the group
I've noticed comments regarding problems with DX7 from the PERFECT MS (ha!).
I indeed am using DX7. I'll just use Atari800Win 2.6a until that "perfect
company" fixes a little something, I 'spose...

those two games are awesome,not all of avalon hills stuff was great. but
the boxes were always first rate.
many hack jobs, and plain bad ripoffs, plus taking parts out of a game,
and making it into another.
lots of bad graphics on some, when they could have done much better, but
those 2 were awesome.
maxwells manor, and mission on thunderhead were also good ones.
thanks,
lance

Sorry to say that, but you're wrong. The 800XE was/is widespread in
eastern europe.

I will look for that breaker utility I had; if I locate it, maybe I can mail it
to you in 8 bit format...

-Ron

I don't have a solution but I admire the problem.

Talk about going the extra mile! Don't put yourself to much trouble over
it, but it would be GREATLY appreciated... Of course, any costs incurred
would be repaid...

> What about Atari suing CBM over Jelly Monsters, or MS's rip of from
> Atari's SIO system (namely USB)

I posted the link to the original Atari 8 bit patent a week or two back. The date on it was 1979 => If you wanted to clone the silicon and make an exact copy of an Atari 8 bit now you could because the patent has expired.

This was intentional and the way patents are supposed to work. A patent is nothing more then exclusive rights to an invention for a period of time in exchange for a complete and public disclosure of the technology involved.

Some things I don't agree with, like being able to copyright an OS vs having it part of a patent mean the damn copyrights run too long on them to be for the public good.

But if tomarow you wanted to duplicate the silicon on a POKEY chip *and* use the chip in a USB design, there is nothing Atari could do about it<'cept they may have copyrighted the silicon layout, ARRGHH!>. That is the deal you make with the patent department.

Hey,
Try doing something in your local area like an ad in a newspaper or perhaps
a friend. Most of the online auction sites require a credit card. If you
have a debit card, you can try Yahoo!

5810. Atari Clearout (Bristol - UK)

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-11 21:30:39 UTC
From: Gary Morton <gary@alma.demon.co.uk>
Message-ID: <39BD4EFF.E9E1842D@alma.demon.co.uk>
Source record: 41979

I recently have been having a spring clean. My old Atari stuff is taking up far too much room. Before I comdemn everything to the bin, I am offering various things free to whoever is prepared to collect them. This will probably only be of interest to any enthusiasts in England. I am located in Bristol.

Firstly I am getting rid of the following books and magazines:-

Compute! books - Mapping the Atari
Compute! books - Compute!'s Second Book of Atari
Compute! books - Compute!'s First Book of Atari Graphics
Compute! books - The Atari BASIC Source Book
Compute! books - Inside Atari DOS
The Analog Compendium
Atari 1050 Disk Drive Manuals
8:16 Atari Newsletter (several)
Atari Input/Ouput (2)
Atari Explorer (2)
Monitor (around 20)
Page 6 (several bound volumes)
Atari User (several bound volumes)

There will be more at a later date including my collection of Antic and Analog (includes some early issues). I also need to ratoinalise my hardware - I will keep some stuff. I have a couple of broken Atari 400's with 48k RAM packs and a working and a broken 1010(?) printer/plotter.

regards...

--Gary

5811. Atari800Win problems

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-11 21:34:52 UTC
From: Gary Morton <gary@alma.demon.co.uk>
Message-ID: <39BD4FFC.3CCD44F8@alma.demon.co.uk>
Source record: 41980

I recently found and downloaded some of the various Atari 800 emulators.
If I can emulate my old favourite software then I can finally part with
all my Atari h/w and s/w disks.

I had great success with V2.6a with a couple of favourites including
Speluker and the submarine/depth charge game whose name escapes me at
the moment! With the latest version of the emulator both games are now
broken. The video of Spelunker is completely random (broken DL?). The
submarine in the other games explodes right from the start.

I know other people have reported problems. Any suggestions?

Can I feed back more details to the developers?

Spelunker broken??

It's always worked 100% (both versions) although the loading screen on
the hacked version didn't work if you selected basic by accident (did
this on emu and real)

Are you selecting 800B in the hardware menu and making sure BASIC
isn't booting in ?

I'll keep this post and have a look since I have both Spelunker
versions, if by any chance there is a problem you can email Rich BUT
bear in mind he is a busy man and Atari800win is a side project for
him so he may not reply instantly or maybe at all.

Just tried them both and Gary is right, the hacked Spelunker does
indeed crash out (graphically) on the 1st play screen BUT the full
version is fine..

Wonder what happened there?

I will try the Sub game if Gary tells me the name, got a feeling it's
the Adv Inc one by Russ Wetmore.

5818. Spare 8bit Hardware on eBay, Decent Prices

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-12 01:31:57 UTC
From: Jessica C <beadsandbangles@earthlink.net>
Message-ID: <39BD87FA.47814BC8@earthlink.net>
Source record: 41987

If you are looking for hardware from the XL era, fell free to drop by my
eBay auctions this week. 3 Days left on all hardware and still some
great steals. Also have some great Star Trek auctions going as well.
Check it out at:

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=beadsandbangles&completed
=0&sort=0&since=-1

Thanks so much and feel free to bid if you want anything. eMail for
questions.
LykeWyse/Jessica Cornn

5819. Atari support bbs

Looking for atari modem fanatics... got my BBS online and I have a file area
for atari platforms..still working on it and am looking for anyone
interested in being the sub-op for this platform on my bbs.

If you still like to modem, please give it a ring (full access first call)

949.654.4590

Jeff

How much do you want to recover the code listing?
What resources do we have? Handy utilities like a sector editor?
How much of a programmer were you and do you know much about disk data
structure?

We may be able to recover the listing (working on a back-up copy) using NOTE
and POINT, a little ingenuity and e-mail...

-Ron

I don't have a solution but I admire the problem.

5821. Where to find SpartaDOS?

Maybe the easiest way is to do that on PC using my ChkBas Atari Basic
decompiler.

I never did work with compilers very much, and don't know what they are able to do. The program is a relatively simple one, and is not very big. The method used to make the program unlistable was something I believe we found in one of the Atari magazines. It was a short and simple method and used a few pokes and something else that I don't recall. It may have been a short bridge from BASIC to machine languange using something other than POKEs. The program remains a small file on a floppy, and I don't believe the method did anything to the disk or any infomration actually written to the disk in the file. Granted, it has been 20 years since I did all this...

One of my biggest problems right now is I have no way of sending this program anywhere. I have not been able to get my Atari set up since I moved, and I currently have no way of getting the information onto my PC. I've been wanting to work towards something like that, but as I've said before I'm not very mechanically inclined as far as creating cables, and I'm afraid I don't really know the workings of such things. I, in fact, don't even own a soldering iron!

When I can whip out the Atari I'd be happy to mail a disk out via snail mail, but until I'm able to get into storage and all that, I'm kind of up the creek w/o a paddle. In addition to all this, it has actually been about 4 years since I had my Atari set up. :(Atari800Win has kind of "resparked an interest of old," and I have really wanted to try and get all my old software together and at LEAST get it transferred over to the PC. At best I'd like to get the machines hooked up together. It has been near 20 years since I've done any programming or the like on the Atari, and I've forgotten all but the simplest of things. I never did venture much outside the world of BASIC, in the Atari days, and therefore never really had to learn a lot of disk structure and the like, so never did. To the people who were serious into "programming," I would be considered as nothing more than a "dabbler," I'm afraid.

As far as how important this all is to me, it's something I've wanted a copy of only to be able to look at and remember an accomplishment that was very

important to me as a child. The program is nothing I would/ could really use now, or anything anyone else would even probably want to use. I'd like to be able to see it work (which I could do now), and would like to be able to change a few things in it. BASICally :) I would really like to have the information to remember some of what I knew regarding Atari BASIC back then, and due to "the memories" aspect of the program.

What resources do I have on the Atari? Honestly, I once had a lot of resources at my fingertips between me, my father, my cousin, and a few others. Now, I probably only have the very basic utilities, and some of those are probably on disks which no longer work. As I've said, it's been a long time.

5824. Demos and AMS Music

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-12 07:31:11 UTC
From: Dan & Jeri Williams <dwilliams@milwaukeepc.com>
Message-ID: <39bddba1$0$23898$39368dfe@news.twtelecom.net>
Source record: 41993

Hey!

When I was younger I had disks of Atari demos and also tons of A.M.S. Music disks. Does anybody else have these. I'm currently trying to get a good collection of software for my Atari 800 Xl and 130 XE. I am going to put it all onto real disks If I get ahold of some of this stuff. I'm also looking for a Boot Menu Maker program, I also used to have one of these, but all my software seems to have dissappeared. Thanks!!

Daniel Williams

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

5826. Atari 8bit Chat Tonight (Tuesday, 12 Sep.) Topic: Disk Image Hunting

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-12 11:07:34 UTC
From: DCM01@USA.NET
Message-ID: <39be0de9.1082707@news.CIS.DFN.DE>
Source record: 41995

This announces our weekly IRC chat for Atari 8bit enthusiasts.
It's scheduled for September 12th, 2000, 10:30 pm Eastern US
time.

Here are the corresponding times for some other
places, choose the one near you.

California: 7:30 pm. Colorado 8:30 pm. Texas 9:30 pm.
London, England: 4:30 AM. Berlin: 5:30 AM. Hong Kong:
11:30 AM.

The topic for the chat will be "The ATR Hunt: Finding Disk Images on
the Internet"

General Atari8 chat is also welcome. If 7 people show up, I
will provide a doorprize. The doorprize is a like new copy of Preppie
II by Russ Wetmore.

This will be a standard IRC chat. It is not a web-based
chat on your browser. You need an IRC client, such as
mIRC. The chat will be on Amiganet. Here are some
servers that will get you there:

irc.whiterose.net
thule.no.amiganet.org
linux.us.amiganet.org
au, uk, se, no & us.amiganet.org

Once you log onto a server type "/join #atari8" and we
will be there waiting for you I hope!

5830. IMID program released!

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-12 13:21:17 UTC
From: Jindrich Kubec <kubecj@asw.cz>
Message-ID: <39BE2DCD.4097D2DB@asw.cz>
Source record: 41899

```
Hello!

I've released program called IMID on my homepage.

It's mainly for gamers and 'romz collectorz'. If you know so called
'GOODxxx' tools, this is something similar for collecting Atari 8 bit
stuff.
When run from commandline with pathname of your collection, it will go
thru all files and will try to identify the contens of the file.
This is the output of the program in the file report.rep (imid path
-report).

IMID v1.01 (c) 2000 Jindrich Kubec <kubecj@asw.cz>
Database compiled: Tue Sep 12 13:05:33 2000
Looking for 3988 known images.

E:/ATARI/SOFTWARE/8BIT/GAME/0/221baker.prg/program.atr
Found '221B Baker Street' [game] in
E:/ATARI/SOFTWARE/8BIT/GAME/0/221baker.prg/program.atr(os/os/os/atr)

Files: 8. Checksums: 13. Found: 8.

The database is really incomplete, it contains only 3988 different image
identifiers :)
```

It will run thru XFD, SCP, DCM and ATR files. It will also dive into
DOS2, DOS3, Sparta Dos, MyDos images. It will also recognize those
K-boot images as normal exefiles and will test the checksums of the
files 'inside'. So if you have SOMETHING.EXE and SOMETHING.ATR created
by makeatr, it will recognize both as SOMETHING. It also understands
JonW and Howfen menus. So if you have boot-only game in menu and also in
bootsector of any disk, it will recognize it in both locations.

Now it doesn't contain identification of any 'useful program', just
games.

Message-ID: <qolsrs4pm7p2iri2f3msicdscbdd6sf543@4ax.com>
Source record: 41900

Is there a repository for atari game instruction guides.
Im planning to sell my atari system on ebay shortly. (It's a fantastic system by the way. Still working on the description. I can't wait to see what happens.)

I have lots of bootlegged games on disks (see http://desktopservices.go.to/files/atari/gamelist.htm

) and would love to find documentation for some of these old games. Most arent too difficult to figure out but it would be nice to try to get the documentation together.

Is there any interest in creating a repository if none currently exists?

Cindy

Hi Cindy,
You could try http://homepages.ihug.co.nz/~aaronat/atari.html The website has several manuals for downloading, including several lump downloads with about 500 manuals each. Surely you could find something useful.

The most common way was to add a line at the VERY end like -
32000 POKE PEEK(138)+PEEK(139)*256+2,0:SAVE"D:NAME.BAS":NEW
Then type in immediate mode -
GOTO 32000

Now RUN"D:NAME.BAS will do like always, but LOAD"D:NAME.BAS will lock up tight
right after the "READY" prompt because BASIC has lost the pointer to where the
last line ends. BASIC needs this info because it stores immediate mode commands
(like LIST, RUN, SAVE"D:...) as line # 32768 ($8000) down at the very end. This
is why the maximum line number we can use is 32767 ($7FFF).

Some protection schemes also add lines:
31995 VNT=PEEK(130)+PEEK(131)*256:REM VARIABLE NAME TABLE
31997 VNTD=PEEK(132)+PEEK(133)*256:REM TABLE END
31999 FOR L=VNT TO VNTD:POKE L,125

This replaces all variable names with clear screen characters so a LISTing is
continually disrupted by a blank monitor. A LISTing to a printer is a little
better; just "}" as each variable makes tracing logic tricky. Using 155 in
place of 125 gives line feeds for an equally choppy LISTing.

-Ron

I don't have a solution but I admire the problem.

No sweat; when you get the 8-bit going and want a project, give a hollar. We can supply the long distance guidance to make it LISTable again with just BASIC, a disk drive, and a few lines of code with NOTE and POINT that you can easily type.

-Ron

I don't have a solution but I admire the problem.

(Ron and Gork talking about making a listable BASIC out of a
BASIC prog. that has made unloadable/unlistable.)
It has been a long time since I wrote my programs to decompile
unlistable BASIC programs. I have no idea how you can fix
a prog. using NOTE and POINT.
I do remember I wrote my programs because of the BASIC B
bug. You save about a dozen times and it becomes unlistable.
So I wrote the program to recover my own 'work'.
I ended up writing two versions. One to list a programs that
just has too many bytes added at the end and one to list programs
that have the Variable Name Table wiped out. The second one
supplies variable names (V1, V2, etc.).
I don't know if Jindroush's pc program will work with VNT wiped out,
probably, haven't tried it. With J. Kubec's program, I think you
have to delete some stuff with a text editor to acutally make a real
LIST file. I know you have to delete some stuff at the end with mine.

My ATR8000 just arrived and my friend is dumping his Atari stuff on me. I was just thinking about burning a CD with my Atari stuff (800 - ST). The SIO2PC via Linux is going to be a very cool addition. BTW in addition to all the normal docs everyone has I also have various docs on the XL for programming, the various Omnimon (for the 800 and XL) stuff and a few other odds and ends. When the garage is cleaned I'll have room to setup shop. I just finished repairing my ASM and I'm wating for a burn of a 32 byte PROM to finish the job. The Atari to SIO2PC will be via the terminal server. I'll be able to share all my software via the Linux server at the same time! Hmmm, anyone need an interface from a PC keyboard to Atari.

Now to figure out where the to put the Vax 3300 and 8600!

Keeper of antiquated technology.

More opinion then fact about what happened. I was using Visicalc at the time 123 came out and quite frankly after a week of using 123 I wouldn't have gone back to Visicalc for love or money.

It was an extremely popular program compared to Visicalc and once it came out they made so much money off of it then ended up buying Vision On<?> and hiring the programmers who did Visicalc.<Brickand? and someone else>

So it wasn't exactly like they just copied the look and feel. They came out with something much better then bought out anyone that could give them trouble. Kind of like MS kicking down $1 mil to DRI for stealing parts of CP/M.

>anything to the disk or any information actually written to the disk in the
file.

It does write the file to disk with the altered pointer whic causes BASIC to lock at the READY prompt; that is how it prevents LISTability.

I did some research on the structure of the SAVEd BASIC file since the last posting. It starts with fourteen (14) bytes containing most of what you need to know to reconstruct the file; bytes 11 & 12 are the Current Statement pointer reflecting the offset to the "POKE PEEK(138)..." line which was executing during the SAVE.

The third byte of this line is the line length token that was set to zero and the fourth byte is the statement length token for the first statement. The statement length tokens are counted from the start of the line to the end of the statement; so the final statement length token is the same as the line length token.

So, OPEN the .BAS file for update (,12,0); (byte 11 + 256*byte 12) minus 256 is the offset from byte 15 to the beginning of the affected line; GET the 2 line number bytes and NOTE the location of the bad byte; GET and save the length byte; GET those bytes and check end of statement (token 20) or end of line (token 22); when you get end of line - take the last length byte; POINT back to the bad byte; and PUT the length byte in its place.

Now it is unlocked with only the Variable Name Table in question; if it requires rebuilding, byte 3 + 256*byte 4 minus 256 is the offset from byte 15 to the VNT. Byte 7 + 256*byte 8 minus 256 is the offset from byte 15 to the Variable Value Table which can identify each variable as $tring, array or scalar. You can also POKE this info directly using PEEK(130-131) and PEEK(134-135) afted loading the file since it is now unlocked.

-Ron

I don't have a solution but I admire the problem.

5855. ATR800, Atari 800, Linux & networking

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-13 03:48:19 UTC
From: njc@CC47532-A.ewndsr1.nj.home.com
Message-ID: <slrn8rtukq.3e5.njc@CC47532-A.ewndsr1.nj.home.com>
Source record: 41919

OK, I'm waiting very patiently as an ATR8000 (w/Atari 800) is to arrive at my door (9/13). I'll have to get the parts and build several SIO cables so that I can hook this up to Linux box. I may extend the SIO2PC prog so that I can hook it up to a terminal server or a TINI board (networked connected to a daemon running on the Linux server).

I'm also about to get 3 more drives (2 810's one with Happy one with something else and 1 1050 with a 6502 mod board we built). An 800 with autobanking Omnimon, software, 850, printer a TRS 80 (how'd that get in there ;-) etc. .

One question I have is does anyone have the source code to Omnimon or Omnimon XL? I seemed to recall that the author (Dave ?) released it a number of years ago.

I guess that I'll now have to sort through all my Atari stuff and get it all working properly. :-)

I've added a switch later which puts 'the real Atari' list file (even
with 155 as line break character), so that it could be 'ENTERed' from
the emu.

--
Jindroush <kubecj@asw.cz>

On Wed, 13 Sep 2000 11:39:47 +0100, Paul Irvine
<mclane@btinternet.com> drooled an embarassing wet spot in his lap as
he typed:

>I was keen to try and find anything unusual or rare that's not on the
>normal FTP sites. (as we all are)
>
>Like the floods on the misc group that we know only to well, there are
>bits that pop up that just are no where else. Mail me the site if you
>like (or not) :-)

Well, I've tried to keep up with everything I could find. I havn't
gone and weeded out duplicates, but at the moment I'm still in
collector mode, so until I'm satisfied that I have virtually
everything there is to get, I'll probably keep it that way. Currently
I have my own collection of stuff, plus a mirror of Closer to Home. I
also have a CD full of stuff a friend over your way mailed me, but
he's asked me not to share yet -- but there are some things there that
aren't in any archive I've seen. I'll see if I can get his permission
to put at least those rarer titles on my archive.

In the mean time, my archive can be found here:

ftp://atari8:archive@ftp.mindfield.dyndns.org:2026
- The 8-bit archive. Quite large and growing whenever I can find
new stuff.
ftp://atari16:archive@ftp.mindfield.dyndns.org:2026
- Still very much in the building stage. I'm currently working to
dump my ST disk collection for TOSEC to include in their next
ABEM flood.
ftp://atari:consoles@ftp.mindfield.dyndns.org:2026
- 2600, 5200, 7800, Jaguar, Lynx. It's all here and as complete as
possible.
ftp://emulation:roms@ftp.mindfield.dyndns.org:2026
- The generic emulation account. Everything but current-gen
consoles and ROMs/images available here. This is where anyone
can upload, as well.

Everyone here is welcome, but don't spread it about. While I've no
problem with fellow Atarians and former Atarians logging in, I'd
rather keep the all-encompassing emulation community to a minimum to
keep bandwidth available. :-)

Oh, and the site's running on my home PC, so it may go down from time
to time. If it's down, just try a little later.

>Join the club...
>
>I'm going to pick up around a 1000 UK discs in a month or so, this guy
>collected anything and everything (so he says) so I hope to find a few
>tit bits that are new.

Sounds good! Hope you do find some new tidbits ... should you care to
share I'm sure we'd all be the richer for it. :-)

>God, I wish I had all my disks still...I really did have pretty much
>everything. If it moved I collected it..

Same here. My only consolation is that I still have my ST disk
collection (which I'm having less than stellar success dumping to ST
images so far). I've managed to rescue a few of my old MODs and
shareware/freeware programs. (Er, okay, one shareware program, one
utterly crap first-attempt at a demo. I havn't lifted the second,
equally crap demo yet... :-)

Some of those disks may be unique, so you should convert them to ATR's
if you can.

I think Yogi was the first to clue into the fact that the floppy media
is failing, and that putting an image on a website doesn't kill the
software (some still called it piracy) but actually allows the
software (which is art after all) to survive.

We had a good chat and gave away the door prize finally, after getting
7 chatters.

Some of the good sites for images we talked about were www.umich.edu
and www.farago.com.

I was around at the time when Yogi was getting stick for his archive, every group has it diehard keep it real people of which I support BUT unlike most other older machines the Atari folk tend to go ape (sorry Steve) about having archives.

I know some people still sell stuff, others sell stuff repacked that used to belong to other people (with blessing) etc but these archives are not there for making cash.
>

I can't really join the chats these days as my daughter is 8months old and I need all the sleep I can get so 4:30 in the morning is rather early for me :-)

No probs...I also made a cd that some peeps in here got a long while
ago. I'd think that whatever was on that which was new has filtered
out to the sites by now.

>In the mean time, my archive can be found here:

Snip...Many thanks..

Will not abuse said account :-)

I always do, the Omnimon docs were OCR'ed by myself and many a person
has had their mailbox made brighter with a nice image amongst other
things :-)

LOL...We all have or little bits out there, somewhere there is a 2 drive 8bit copier by myself, a couple of menu programs that a couple of us knocked together (Mostly an old mate called Steve) and the odd crack , trainer and my fave...A redone Sidewinder which auto loads a great new set of levels, released as Rescue at Libya or somesuch. :-)

I feel a Spelunker or Jumpman session coming on :-)

These are the things I remember being replease (not necessarily into
the public domain): Atari 800 OS, 1050 drive OS (or one of the 3rd
party derivatives) and omnimon and omnimon xl. Unfortunately I can't
find the code and I know I d/l'd it. It's with the drive code so when
I find one I find the rest.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Source record: 41856

FamilyNet HQ: Telnet:\\www.family-bbs.net

Ed,

Allow me to forward your rebutal to the Atari 8-bit newsgroup since I have yet to see it there. It's only fair.

You've had mundane issues, and we've talked amoungst all this. I've been very patient with you amoungst the 16 months that I've waited for this. I moved onto other projects, and took on other projects. I started applying the breaks on all this by February when I saw that this was swiftly approaching a year. Set an April deadline. That past, and after that, so did other appointments to meet me at the First Saturday Sidewalk Sale, my house, etc. In early August after so many broken appointments and promises I gave you my final ultimatium to return the parts. You made arrangements to do so before the date, and again, broke that promise.
Granted, you live in another state, but there is mail afteral.

Ed, it was a sad day when I had to post this message. The cartridge boards really didn't matter to me. The six pack cartridges were iffy to be begin with, but you wanted them, I made a deal with you in exchange for your time, and in the end, I was even willing to give you half the cartridge boards for ATTEMPTING to put them together and your time spent TRYING to contact Video 61 for the cartridge plans. Being that you are the old associate that you are to me, being from my original days (the eighties) when I was first in the Atari scene, you had a special place in my memory. I wanted you to succeed in getting those parts together or if nothing else, getting them back to me when I started to request that. That's why I gave you as long as I did.

Like I said in my final message to you, if they were not to me by September 1st, you could keep the cartridges since you would probably have enough grief from the
Atari community over me warning them about you. That was the choice I gave you... the cartridges or your reputation in the Atari community. I extended this deadline to September 2nd to give you a chance to show at the First Saturday Sidewalk Sale, and to September 3rd and 4th to allow to extra business days in the events you sent it in the mail at the last minute. The only other choices I had were to:

1) continue to wait and receive additional broken promises 2) write it off 3) write it off and warn others so the same didn't happen to them.

Ask anyone here... ask yourself. If you made a deal with someone to fix something, and then time passed with no results, you would get a little impatient. I've heard some on here say they would have done what I did after as little as three to four months.

So that person doesn't fix the device in a timely manner. That's cool.
So how would you feel when that person says he will return the item, and after six months of broken promises "I'll meet you", "I'll send it", etc, what would you think then?

Ed, I'm sorry to say this, but look over the last 16 months... many
chances
many promises, packages that were never sent, appointments not kept. I've only made this known to the newsgroups as a fair warning to everyone else.

Like I said, the cartridges in the end didn't matter to me, and in the end the greatest damage is that I now know that an old associate has shown himself untrustworthy. With Atari hobbyists being as rare as they are, as helpful as you have been in the past, this is a painful fact to live with. More painful is the thought of someone else having to go through this.

You have three choices at this time. You can seek to restore what was lost with myself and those here. I'm not above forgiveness, and life is too short not to. The message to the various newsgroups was written as a last resort and warning to others. If this is something that means something to you, I'm also not above letting all those I warned have an update to let everyone know all was settled.
You can walk away from this as I have. In time, perhaps others here would have forgotten what has transpired here. In time you can show others through your actions that I was quite wrong.
You can retaliate against me. Of course I've already gone through pain knowing I have an old assocaite I can no longer trust. You in turn will only cause yourself pain in the long run by doing more.

I'll leave it that, and leave it up to you,

Greg Goodwin

FamilyNet HQ: Telnet:\\www.family-bbs.net

A good Thursday to everyone,

Looks like we have made it through yet another week quite well.

Like so many, I'm looking forward to tonight's 8 pm CST Atari chat
session at...

http://stargate.cs.swau.edu/atari

Much to talk about like, like how to get a JUGS system working for
the Jaguar, and the fact that the article about our club has been
reprinted four times so far throughout the country. :)
Gotta love it.

And check out the newly updated club website when you get a
chance...

http://www.geocities.com/lady-aramis/index.html

We've added a mission statement, a section on how to find Atari stuff
in the Dallas/ Fort Worth area, how to connect an Atari to a Newton
MessagePad, and Dallas Atari support BBS's (to name a few).

Take care and see all of ya'll at the chat tonight!

Greg Goodwin / Doctor Clu

It is really sad that Atarians have one fewer of the people that we can trust
to follow through with trade transactions. I have encountered a few; few and
far between fortunately. But, we cannot help but follow
through with the transaction even though there are the bad seeds out there...
PLEASE have the respect to follow through with a trade transaction before even
offering. Most of us are patient; just don't take an extremely long period of
time to respond.

To Ed William's credit, he was always good at returning E-mail and making
arrangements to do something. No long wait time in this case a good lot of
the time for replies.

Well Lance, actually that was Ed Williams writing from Teresa's E-mail account. Probably checking newsgroups from another account other than his usual provider.

It was some cartridge boards (made by Bill Williams) that Ed was going to assemble for me. He's saying that he tried contacting you to get the schematics so he could build those for me. However this is immaterial at the moment. I've known for a good while that he was unable to get this from you. After April/May this was no longer an issue, as by then I was asking him to wrap it up or ship/bring it back by that point in time.

Thanks though,

Greg

The name of the game is Sea Dragon and the sub explodes right in the
beginning, no matter what you do with the joystick. As far as I remember,
the same happened with older versions of Atari800dos, not only with
Atari800win 2.6a.

No problems with Spellunker.

Hi, Any help appreciated..

After finding my 130xe and software the other day and finding that it all works !!, I've been thinking about backing up my old software for posterity. I've read various options for connecting my 1050 to my pc, but all seem to involve building your own cable, which I'm not that confident about doing, also if I remember correctly I had a us doubler? eprom put in the drive, will this affect it.

Is there anywhere/anyone I can order a ready made cable from in the uk ?

All my discs are compilation double sided boot disks with homemade front menu's, grouped into game type, will I be able to image the entire disk and run it as normal from the menu's, or will I have to return each program to and individual disk.

I have over 40 double sided disks to work through at least 25 disks are going to have 8+ games / side = 400+ games and the rest are 2 games / disk / complete boot disks, I'm bound to have something interesting tucked away in there somewhere for anyone that can help me...:-)I'll start compiling a listing.

Mark

For what it's worth, I have two versions (different cracks, I suppose) of
Sea Dragon, and have no problems with either one, running Atari800Win, 2.6a.
I believe they both came from one of Yogi's compilation disks...

US doubler should be no problem. I have one drive with a Happy and
one with a Speedy enhancement in it. But they work with a real
Atari and therefore work with a PC which sends the same commands too.
Being in a similar situation as you I bought a 1050-2-PC cable from
Nick Kennedy. With the cable he sends you a disk with the latest
version of his SIO2PC software. Under MSDOS in works great, under
windows there are problems, but my w98 lets me boot with MSDOS so
if you know it that's no problems. Best to send Nick an email at
nkennedy@tcainternet.com and ask him if he's willing to make you
a cable.

If they are 128 byte/sector formatted there should be no problem.
However I have some disks SIO2PC can't read and suspect they are
the special formatted 256 byte/sector disks but I'm not sure
about that. Maybe I'll verify that after I finished saving all
the other disks to atr images.

Many thanks Janka,

I'll drop him a note, I'm getting quite excited about the whole
project, it would be a shame to see it all disappear.
I know a lot of the software will be out there, but it's those personal
touches I want to preserve..., Any sort after stuff I should keep an
eye out for, I seem to remember having all sorts of interesting things
(well at the time they were anyway :-))

IF you do have the USDoubler and IF you have a 5.25 on the PC, then there is a European (German?) written utility which can transfer to & from the PC with MyDOS format DD diskettes; it works at the file level so would require DisComm to move a complete disk image. Another utility claims to do entire sides, but gave me no success. You could also convert a SD disk directly to an .ATR or .XFD file on a DD diskette for transfer.

>will I be able to image the entire disk and run it as normal from the menu's,
>or will I have to return each program to an individual disk?

Once transferred, the images will function normally on an emulator unless they have some really really exotic code.

>I had a us doubler? eprom put in the drive, will this affect it?

The doubler chip should not interfere with SIO2PC cable operation.

>Is there anywhere/anyone I can order a ready made cable from in the uk ?

I can be NO help here! I'm about 8 or 9 time zones away...

-Ron

I don't have a solution but I admire the problem.

>
>Ha ha..Someone after my own heart.

I can but try. I'm a bit anal about my emulation collection. I hate
burning stuff to CD only to find there are a few more loose ends. I'd
rather get it all and then burn. Then it's all there in a nice tidy
package. :-)

>No probs...I also made a cd that some peeps in here got a long while
>ago. I'd think that whatever was on that which was new has filtered
>out to the sites by now.

Most likely. But I know there are still some images I'm missing.
Several people asked for particular games in the mostly-dead
alt.binaries.emulators.atari8bit, and searching my collection revealed
I didn't have a one of 'em. So ... still I hunt. :-)

>Snip...Many thanks..
>
>Will not abuse said account :-)

You're welcome to it, as are others here. If I can be of assistance
to those who also worship the great and powerful Fuji, then I'm happy
to provide. Plus, there's always the chance that someone notices
something I don't have and uploads it. :-)

>I always do, the Omnimon docs were OCR'ed by myself and many a person
>has had their mailbox made brighter with a nice image amongst other
>things :-)

Sadly, I don't think I have a single shred of 8-bit paraphenalia left.
About all I've been able to find are a few really old BBS logs, a map
I drew of AR: The City back when I was disgustingly addicted to it,
and some other miscellaneous paper bits full of notes 'n stuff.

>LOL...We all have or little bits out there, somewhere there is a 2
>drive 8bit copier by myself, a couple of menu programs that a couple
>of us knocked together (Mostly an old mate called Steve) and the odd
>crack , trainer and my fave...A redone Sidewinder which auto loads a
>great new set of levels, released as Rescue at Libya or somesuch. :-)

Heh... the stuff I wrote for the 8-bit probably never got beyond the few local BBSs I uploaded them to. Let's see... there's Dog Gone, a really badly written Atari Basic game I wrote and was going to submit to Antic before I came to my senses and realized my code could be used for an article on how NOT to program. (It was my first attempt at writing a game using redefined character sets, and one single player sprite. It was the whole player. One red strip along the left side of the screen, and other than a contrived excuse for adding it to the game (a "Safe Zone") its sole reason for existence is because I'd just figured out how to do it in the first place. :-) Then there's Nibbler, named after the arcade game of the same name, but shamelessly ripped off (but enhanced) from the Antic (Analog?) type-in called Darkstar. It was also the first and only compiled Turbo Basic program I wrote.

Chances of finding those: 0%. :-)

>I feel a Spelunker or Jumpman session coming on :-)

Jumpman ... that was the first casette game I ever got, for the first 810 casette data recorder I ever got. It took forever to load with all that annoying beeping, but at the time, there was nothing sweeter. :-) I got lots of mileage out of Spelunker, too. Still do. :-)

Hi,
Check out my eBay auctions for some last minute Atari deals. Less than 24hrs left on all Atari items. I have an Atari 1200XL, 1027, 1050, 1010, and a 1030 going right now as well as some interesting guatemalan silver necklaces and TONS of Star Trek items and self help books. Check it out here:

http://members.ebay.com/aboutme/beadsandbangles

Click on the link at the bottom of the page to access my current auctions and feedback;

From: Teresa Williams <Teresa@jam.rr.com>
Message-ID: <%AXv5.6830$RJ.31005@typhoon.austin.rr.com>
Source record: 41937

Attention:
to all that have read this Thread!
Greg is mistaken there was not an Atari Item at issue.
There were the six pack cartridges 20 of them of which
10 were to be returned to Greg, and I was to retain 10.
the items I received from Greg were 20 bare boards and
20 blank cases.
There was no time limit set and no payment arranged.
the deal was on my free time I was to assemble the carts,
I do not have nor have had any schematics for these cartridges.
I asked Lance at Video 61 for Schematics over a year ago and
he has better things to do, than to help someone with these
carts. For one, he said they don't fit the cases (without serious labor
intensive work) and they are not easy to write programs for "Ask Lance".
So everything has been trial and error. As for as Theft of his
Atari Item I deny any intentional act. First, Last summer I was in an
auto accident and Greg knew this. Second, My contract with IBM was over
and I had to look for a new job Greg knew this as well. With the
work on these cartridges taking up to 3 hours each to solder and trim the
cases involved and me supplying the sockets and EPROM's, I think that
to put me on a time table after the fact is poor business on Greg's part.
Greg, you may pick up your cartridges at my attorneys office in Dallas in
about two weeks.
Thank you
Edward Williams

Not related to your Omnimon question, but.....

I was planning on connecting my 130XE to my Linux Server via an 850
interface and use it as a dumb terminal when I am not playing games on
it. I have one question: is there a way to run a dumb term via the SIO2PC

cable? What is the TINI board? (Okay, 2 questions....)

Thanks,
Chris

Too true Thomas, although some of the older companies like Factor 5
(Hi there Julian, finally looked at Masterblazer ;-) have gave their
blessing to download their old Amiga titles.

Not as many companies as I'd like to see but that has never stopped
me having an archive of my own :-)

I think Wes made a statement, something to the effect that FTE was not able to hold up its part of the bargain<contract?> so the rights reverted to him.

Not sure where I saw it, but I thought some of the plans for things like the Newel 1 meg upgrade were made availible by him on a web page somewhere. I never saw the source code for Omnimon, but knowing how things seem to go, it could be it does not exist in a usuable form anywhere.

Message-ID: <39c29337$1_1@athena.netset.com>
Source record: 41872

ATTENTION RETROGAMERS, COMPUTER COLLECTORS, VIDEO GAME FANATICS!!!!

WE'RE BACK!!..

CCAG 2001
(Classic Computer and Gaming 2001)

If you like collecting old computers, video games, and enjoy using them
still, then come join us on:

June 23rd, 2001
9AM till 6PM

National Guard Armory
IT'S ON ROUTE 57!!!

(actual address)
3520 Grove Avenue
Lorain, Ohio 44055-2048
(On Route 57, going North of I-90/Route 2)

IT'S FREE!

Both vendors and attendees!
Computer User Groups and vendors inside, flea market outside!

Setup: 22nd, June, 2001
6PM-10PM

Please Call Ahead for Reservations:

Jim W. Krych jwkrych@n2net.net
440-979-9295
Fred M. Horvat fmh@netzero.net
440-286-2566
And these other CCAG 2001 organizers:

Please visit this site:
http://tomheroes.com/ccag.htm

As of 9/15/2000
User Groups:
TI Chips
Cleveland Classic Atari Group

Vendors:
Retropolis
Songbird Productions

Video Game Connection
Ramcharged Computers

People/Organizations:
Tom Zjaba
Tim Snider
Curt Vendel(Atari Historical Society)

We are looking to do a "Classic Game Experience" this year!
One room is going to be set up for playing classic computer and video game cartoons and commercials. The other room is going to be an emulator room-MAME, etc. We are hoping for some people with arcade systems to bring them-will probably need a small generator for that.

See ya at the CCAG!

5903. Where to get a decent joystick...

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-15 00:00:00 UTC
From: Eric Thomas <ethomas@best.net>
Message-ID: <8pu6j6$q1j$1@nntp1.ba.best.com>
Source record: 41874

Okay, I've given up - for now - on the notion of converting one of the original Atari joysticks for use on my P.C. (too complicated), but I'd really like to play with some of the old games, now that I've got them successfully transferred.
However, all I see for sale these days are those "Gorf"-style joysticks that are so favored for flight simulators/combat games - but they stink for classic and older titles! Can you imagine trying to play "Action Quest" with one of those? Give me a break!
So the point is: does anyone know where in the San Francisco Bay Area, California, I can go to buy a plain ol' normal, decent joystick for use with a standard PC game connector?
Prefer to buy retail, as opposed to mail-order or online.
Thanks for your input.

Regards,

-Eric

FamilyNet HQ: Telnet:\\www.family-bbs.net

Hi everyone,
I am doing some Atari christmas shopping and I need the following items.
email me at jessica.cornn@fmlynet.org if you can help:
FOR THE COUSIN THAT IS GETTING NOSTALGIC- Atari 2600 system, no games please
(unless you can spare a copy of Pitfall). System Must be
working and in good condition. (games will be purchased At O'Shea Ltd.)
FOR MY FRIEND THE COMMODORE USER- Commie games, hardware, software, anything.
She is sort of a big fan of the commie system and I will buy anything as long
as it works and as long as Casey does not have a duplicate somewhere.
FOR MY COMMIE FRIEND WHO JUST BOUGHT A PC- Old version of windoze, on 3 1/2 or
5 1/4 media. DOS games helpful as well. FOR MY MOM- Old Atari games reissued
by Hasbro. (We already have something like 700 ROMS for Stella) FOR MY
NINTENDO USING COUSIN- SNES games, any.
****
PLEASE IF YOU HAVE ANY OF THESE ITEMS YOUW OULD LIKE TO PART WITH, EMAIL ME!

(Atari BASIC and OSes).
No, they're almost certainly not PD.
I would guess the 8-bit OSes are Hasbro's now.
Hasbro has allowed something, forget what, but it allows continued
development for the Jaguar, I think.
Atari BASIC was never owned by Atari, it was licensed from Bill
Wilkinson or OSS, if I'm not mistaken.
Then OSS sold to ICD. Then ICD sold OSS stuff to FTe.
So, my guess is the elusive Mike Hohman (Holman?) owns the rights to Atari
BASIC. Lots of guessing/maybes here. Correct me if you know better.
Interesting question. For practical purposes, only XFormer got permission
to use the A8 OS, and maybe BASIC too, I dunno.

I bought a very nice adapter from a Belgian person (forgot the name, but
could look it up for you), and still use my CX-40's on my PC :-)

Works great! Maybe somebody else remembers the person I'm talking about?

Richard

I seem to recall hearing that there was some problems with FTE and non payments as well. I don't recall if a full outcome was ever posted here. I will say this though; around the time of the Newell / FTE deal, I received a box Atari equipment, Disks, parts, etc. from Wes, its been a long while since I've looked (5 years) but I seem to recall seeing at least some version of OSNXL and FastChip Sources on those disks.

Wes Newell's site for schematis is

OK, OK....here's what I got...
STuff: Atari 520ST with 4 megs ram, Megafile 30 upgraded to over 100megs, SM124 hi res monitor, 2 ST mice, Spectre GCR 3.0, NeoChrome, and a Winnie The Pooh game for my daughter (Everything is MINT CONDITION after a little Windex and elbow grease) and all cables.
8 bit stuff: AtariArtist, Joust, Microsoft Basic II, Basic XE, Gato, Robotron 2084, Hardball, and Mario Bros cartridges, as well as an Atari 1020 Printer

I think I made out pretty good...considering it was a little UNDER 100 buckos that I spent, including the entry fee into the show! I didn't really want a monitor, but the package ST deal was too good to pass up. The 2 mice are fabulous. I have been trying to get a megafile 30 meg hard drive off ebay for a long time now, but the price always shoots WAY up past the 60 smackers I spent on this entire ST system. If anyone ever gets a chance to hit an Atari computer show, DO IT!!! It was a blast! Oh well, off to the MarketPro computer show I go!
cheers
Steve.

Well, I wasn't going to say anything until that last line there. As an outsider, reading both Greg's post and yours, and making an unbiased judgement - sounds to me that Greg has some real legitimate gripes, and you offered up a lot of excuses. Got things occupying your life? Don't we all - that's no excuse to not spend the hour or two it would have taken to box all his stuff back up and send it to him. Your entire post was riddled with excuses:

"I do not have nor have had any schematics for these cartridges. I asked Lance at Video 61 for Schematics over a year ago and he has better things to do, than to help someone with these carts."

Did you tell Greg this as soon as you found out? Did it really take a year to figure this out?

"As for as Theft of his Atari Item I deny any intentional act."

Right, you unintentionally kept his stuff for almost 2 years and were non-responsive about the whole thing on accident.

"First, Last summer I was in an auto accident and Greg knew this."

How did this affect your ability to return his stuff? How is this Greg's problem?

"Second, My contract with IBM was over and I had to look for a new job Greg knew this as well."

How did this affect your ability to return his stuff? How is this Greg's problem? The fact is, you made it his problem. *You* made it his problem.

"With the work on these cartridges taking up to 3 hours each to solder and trim the cases involved and me supplying the sockets and EPROM's, I think that to put me on a time table after the fact is poor business on Greg's part."

What is poor business is to write off a week's worth of work to two years worth of excuses.

"Greg, you may pick up your cartridges at my attorneys office in Dallas in about two weeks."

I'll be honest - I don't know who you are, what you do or what your history with the Atari community is. Apparently a number of people here have dealt with you satisfactorily over the years. That's fine. But after reading this recent exchange, I would personally never deal with you - you sound like a man loathe to accept responsibility, shunning accountability like it was going out of style. You offer up excuse after excuse, and then call the plaintiff a "flake". Why in the hell does he have to pick up his stuff from your attorney's office in Dallas, almost 2 years after the fact? No post office nearby? Lost your legs recently?

It's pretty clear who the flake is around here. Your posts have been utterly pathetic - it's people like you that seriously piss me off, because it's people like you that affect other people's lives without consideration, refusing to accept accountability all the while. Everything is everyone else's fault in your life, isn't it? Loser. You owe Greg big-time, and should be grateful he doesn't sue your ass or have you arrested for theft. Wouldn't be too hard to prove his case, I don't think.

Now get off your lazy, non-accountable ass, box up his stuff, and send it back to him. Can you be man enough to at least do that?

Mike

Ok,

Ill addd my $0.02 to make things more confusing.

From what I remember a few years back when PP was getting back into AR I read a msg from him talking about the past and him getting screwed out of any money. But, it was also in the contract that after a certain period if no other software related to AR (or if the series wasnt finished in a certain time) all software copyrights reverted back to him. So I believe he owns the AR trademark/software? He may have sold some of this to get Monoliths help in the PC version. That contract ended with PP packing up and moving back to Hawaii where he was going to finish off some contracting work he had and then would devote full time to the ARO stuff.

Thats the last I heard. Nice screenshots but nothing ever produced.

Never heard the story that he was done but couldn't publish. That sounds fishy since we could've had 'Other Reality The Urban Area' vs 'Alternate Reality the City' :)

I only wish the series would be revived or finished since it was one of my favorites.

Bring that up to .03
> Thats the last I heard. Nice screenshots but nothing ever produced.

The screenshots were very nice. They indicated two positive things to me, that they had a very talented artist on board and that the atmosphere was going to have the look and feel of the earlier versions.

But the down side it the pictures appeared to be done in a static drawing program vs 3d modeling.

IOW: Didn't even get to the drawing board with the 3d modeler AFAICS.

Kind of a shame Phil does find work as a game designer with one of the big online game companies like Blizard or EA. His ideas are just too big for a lone cowboy.

I recall some of the stuff too, something like 1 or 2 versions of the
RAMDISK handler for using RAMBO with MYDOS or something. This was very early
on, before Tim Patrick wrote one that would recognize just about every
hardware mod there was automatically.

I have spoken with Dr Clu several times within the past year, enough to consider him a friend of mine, and I KNOW that he has a multitude of things to do with his life besides sitting around and tinkering with hardware (though he enjoys it deeply). However, he has the respect to bring immdiate attention to pending trade transactions and if it is beyond what he can comprehend, he will send it back, within a week in fact.

From experience, I ALSO KNOW that Greg is a patient individual in regards to waiting for an item. He can understand having the lack of time, money, etc. for whatever the trade transaction entails. But, he waits. As he has said to me before, "I usually have the feds banging down the door after 6 months." I think this is fair enough.

I am sure Lance Ringuist attends to giving a yay or nay to a project much faster than a year from asking. Why should you wait such a long time?

> "As for as Theft of his Atari Item I deny any intentional act."

Ditto here.

> "First, Last summer I was in an auto accident and Greg knew this."
>
> How did this affect your ability to return his stuff? How is this
> Greg's problem?

My car was stolen last summer and I had major surgery then following October. Sure, the bills may be horrendous but you could always ask a friend or relative to ship the package for you. I am absolutely sure Dr. Clu would have been understanding within a month or two of the incident; a year or two is really ridiculous.

> "Second, My contract with IBM was over and I had to look for a new job
> Greg knew this as well."
>
> How did this affect your ability to return his stuff? How is this
> Greg's problem? The fact is, you made it his problem. *You* made it
> his problem.

What, did you go into a clinical depression that you did not imply in your post. My father and my family all know about contracts being up, etc. but you could have always scraped up the funds to ship it, even bookrate (Clu thought it was a really smooth trick when I shipped my SuperSalt diagnostic to him bookrate).

> "With the work on these cartridges taking up to 3 hours each to solder

Let's see here... enough for 20 carts... 20 X 3= 60 hours. Many people (myself included with education, volunteer work, selling on eBay, etc.) spend that much time at a job every week. Would it have hurt to make this a weekend project spread out over a couple or three weeks?

> "Greg, you may pick up your cartridges at my attorneys office in Dallas

Clu has dealt with him many times over the years, friends from the BBS scene, trade partners, etc. He had good cause to trust you.

> But
> after reading this recent exchange, I would personally never deal with

> recently?

This sounds like you are hiding behind an attorney because you fear or dread what the plaintiff will say or imply about you. It was your mistake to wait nearly two years, perhaps more if Clu had not taken action, you brought

yourself into this situation. You are the only one in charge of your destiny, please recognize that.

> It's pretty clear who the flake is around here. Your posts have been
> utterly pathetic - it's people like you that seriously piss me off,

You should be very lucky Dr. Clu is the type of man he is. I think that he would have really sued you out of house and home if he would have liked to, but, of course, he does not want to do that. He instead took the community notice route and perhaps made the water ripple more to the benefit of everyone instead of to just him and the Dallas/Ft. Worth area.

On Fri, 15 Sep 2000 15:10:01 -0700, "Eric Thomas" <ethomas@best.net>
drooled an embarassing wet spot in his lap as he typed:

>Okay, I've given up - for now - on the notion of converting one of the
>original Atari joysticks for use on my P.C. (too complicated), but I'd
>really like to play with some of the old games, now that I've got them
>successfully transferred.
>However, all I see for sale these days are those "Gorf"-style joysticks that
>are so favored for flight simulators/combat games - but they stink for
>classic and older titles! Can you imagine trying to play "Action Quest" with
>one of those? Give me a break!
>So the point is: does anyone know where in the San Francisco Bay Area,
>California, I can go to buy a plain ol' normal, decent joystick for use with
>a standard PC game connector?
>Prefer to buy retail, as opposed to mail-order or online.
>Thanks for your input.

I don't personally know of any decent digital sticks for the PC; they
all seem to be analog, and I really don't like analog sticks. I use
an MS Sidewinder joypad, and it's a little annoying (as most joypads
are) but it's pretty solid and works well enough.

5932. Tape to disk?

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-17 00:00:00 UTC
From: Mike Kohary <mkohary@earthlink.net>
Message-ID: <39C49654.5A3FF264@earthlink.net>
Source record: 41751

I'm in the process of preserving all my old Atari data, transferring disks to my PC, etc. I've come across a problem: I have 7 tapes with data on them, and an Atari 410 data recorder. The problem is that the recorder's counter doesn't work, so there is no way for me to recover all the programs on a given tape, since I don't know where the programs begin and end.

One solution would be to buy a new recorder off of Ebay or something. But I was wondering if there are any utilities available for the Atari that would be helpful in my case? For example, a utility that transfers tape directly to disk would be very useful. Can anyone think of something that might help me out here?

Thanks,

Mike

But you can hear where they start and end. Just takes a little time. I think you can POKE 54018,52 to turn motor on and POKE 54018,60 to turn it off again.

Just play it and try to load it. The problem would be if the previous one had more stages, but then just keep on going until you find the start of the next file.

Well, I was simply trying to cload programs from the tape, and then save to disk. Unfortunately, I've found that most of my tapes have the first program saved badly, hence my dilemma. (I'm sure you all remember how unreliable tape was; I saved each program 2-3 times in a row, but I've found that the first copy on each side of my tapes is bad.)

To respond to this message, please use the enclosed email address rather than your reply button. Dealer enquiries are welcome.

- Last Updated 09/17/00
- Sold items removed

I have a limited amount of brand new Atari Jaguar items for sale or trade (these are not refurbished units). These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25 - Only a couple left

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Team Tap (4 Player adapter) $20
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $10
- RF Switch Box $5

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- An original Intellivision keyboard for the original Intellivision
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

It needs a good home, I think it will find one. You did a great
discription but the starting bid of $100 is not going to catch too many
people's fancies. Anyway, if it does not sell now, lower the bid to
$10 and i promise you that you will coupe $100 out of it; not too many
bidders would like to start that hig (though If I had the cash right now, I
would).

IIRC the Atari/410 stopped on their own when a CLOAD, LOAD"C:, or other tape operation was completed.

>I was wondering if there are any utilities available for the Atari
>that would be helpful in my case? For example, a utility that transfers
>tape directly to disk would be very useful. Can anyone think of
>something that might help me out here?

There were some old ones called COPYCASS.BAS which would read any single section of tape code and write it back out to tape or to a disk file and CAS2DISK.BAS which could convert single stage boot tape to a boot disk. Neither could handle multi stage boot tapes like Zaxxon... Both used a large $tring as a storage buffer and either CIO or Resident Disk Handler to do the writes.

CopyCass could read right down a tape sequentially sending one program after another to a disk file, stopping only to ask for a filespec.

-Ron

I don't have a solution but I admire the problem.

The problem is, I can't seem to successfully load the first program from
any of my tapes. Hence, the CLOAD errors out in the middle, and I can't
count forward to the next attempt (I saved most programs 2 or 3 times in
a row, due to the unreliability of tape saving). For all I know, the
tapes are no good at all, but I have to try. :)

> There were some old ones called COPYCASS.BAS which would read any single

My tapes are all just BASIC programs, so I have no worries about multi
stage boots, etc.

> CopyCass could read right down a tape sequentially sending one program after
> another to a disk file, stopping only to ask for a filespec.

Bingo! This is what I want - it sounds perfect. Anyone know where I
can get a listing for it (to type in, just like the old days)?

Thanks,

Mike

>
>I was wondering what your favorite Atari 8-bit
>video game happens to be?

Alternate Reality (both City and Dungeon)
The first game to have 3D texture mapping (albeit
predrawn), a full musical score, and what would
have been an epic, ongoing storyline. (Ultima and
kin were just different episodes of the same idea)
Plus, it just kicked ass. I still haven't found an RPG
that beats it for playability, addictiveness, immersiveness,
and atmosphere.

All Lucasfilm games
Well, what more can be said? Lucas Arts had their
act together from the get-go, and they never failed to
produce polished, highly playable games with stunning
graphics and sound.

Alley Cat
Well, hell, this is just a true classic. The 8-bit
version was the best, and it had some very clever sound
and excellent graphics, plus lots of variety wrapped around
solid gameplay. It was worth the minor irritation of having to
use a translator disk to play it on the XL/XE machines.

Spelunker
The quintessential platformer.

I could go on and on -- I had so _many_ favourites, but these spring
readily to mind.

Mindfield

Not true !! The 800XE was released in big quantities (many hundred thousand pieces) in eastern europe. Besides, both the PAL versions of the 65XE and 800XE do have a CART+ECI slot. I own both XE`s although I am living in (western) Germany... -Andreas

> > Windows and from pure DOS mode).
> >
Well,
I own a SIO2PC with manual. And the manual says (maybe true, maybe not)
that SIO2PC merely works in pure (!) DOS mode i.e. MS-DOS 1.0 - 6.22; it
does not work with any Windows based OS (95/98/NT/2k) and it even does
not work with the DOS under Windows (DOS 7.0 or later) since Windows
installs some things (drivers, etc.) at boot-up time which the SIO2PC
does not like at all. When you enter the DOS command line from Windows
these things (drivers) are stil there and thus SIO2PC still does not
work...

In short word: You need a DOS machine to use SIO2PC without errors. A
DOS machine means pure DOS. My PC is a 486 machine with MS DOS 6.22 and
SIO2PC works fine here... -Andreas

P.S.: I have not yet seen anyone who got SIO2PC to work with Windows
(not even the DOS under Windows)...

For AMS sounds try to find XL-Search or Umich or buy the Pooldisk CD ROM
2 from Bo and Ernest Schreurs. There you should find at least 26
double-sided disks (26 because ranging from A-Z) with such sounds...

(Getting sio2pc to work.)
I haven't tried sio2pc, actually.
I use APE 1.17. With this and my APE cable (1489 chip), I can
use it in from DOS prompt or reboot to command line only, using
a Win 95 computer. It works fine, except I can't get the modem
options to work.
I haven't heard much about the Win 98 version of APE, but it
will work with Win98.

Well, it would have to be...

Airball

This game took graphics to a peak on this platform, I thought. In addition, it had some extremely deep gameplay and adventure. The controls can be a little touchy, but you get used to them and master them if you persist, and it pays off in many hours of fun! Some really weird rooms to explore, some passages seem to go on forever, and dead end on you with no reason. I even found some walls that look solid but let you pass through.

Ultima 3 and 4

No explanation needed. These were "Real" role playing video games, not like this anime/final fantasy crap. (in my opinion, do not take offense please)

Mario Bros.

Strange that the XE cart of this game is way better than the 5200 or the 7800 versions. It looks and plays so close to the arcade, and really shows off this system well. It seems to be completely re-written from the ground up exclusively for the XE. What was Atari thinking, though, releasing Atari 8-bit computer games in 1988, when everyone had a Nintendo and a Genesis, not to mention an Amiga and an ST, by this time. Weird.

Pitfall II

This version has a whole second game, which is not included on the 2600 version. Complete the game, and it starts over again with a whole new HUGE world to complete, completely different from the first one.

Battlezone

For the time, this was the best version of the game available. Gameplay is pretty darned good, even if the framerate is a little choppy by todays standards. It was surprising too, all the way into 1987, when Atari actually released new cartridges for this system, which was pretty much over the hill by then. I remember buying it new and thinking it would be worth a lot someday. Well, it isn't really worth much, but it is still fun to play.

those games might not be copyrighted, and there might have been some
trouble over them.
many were made behind the iron curtain, and we did not recognize there
rights, and vice versa.
when the curtain was lifted the original authors stepped forward, and
started to make a fuss.
that is when derek fern dissapered along with micro-discount.
there was a time when they wanted us(what few u.s.a. dealers left) to
quite selling them, but if they were not copyrighted we have everyright
to, and we told them so.
if they wanted to take us to court, fine.
but without copyrights they had no case.
thanks,
lance

The Digital Antic Project (http://www.atarimagazines.com) is proud to announce that the full text of every issue of Antic Magazine is now available on the Web. Devoted to the Atari 8-bit and ST computers, Antic magazine published 88 issues from April 1982 through July 1990.

This site launched with two issues on July 27, 1996. More than four years later, the project's volunteers uploaded the final issue. The site includes 1,700 articles, 2,400 images, and 1,600 downloadable program files, using more than 100 MB of disk space. More than 30 volunteers have contributed time to the project.

Although the Digital Antic Project has reached an important milestone, the effort is far from over. The volunteers have already begun digitizing two more magazines published by Antic Publishing: STart, which focuses on Atari ST computers; and Antic Amiga Plus, which focuses on the Amiga platform. (People interested in donating time or magazines to the cause are encouraged to send e-mail to savetz@northcoast.com.)

Well, whats wrong with a little partisanship? (Not that I disagree
with you though....) ;)

> Mario Bros.
>
I think I have a genetic defect in that I have despised all Mario
games from the first to the last. Yet, 'despised' is too strong a
word- perhaps more accurately, I've found them so completely
irrelevant to be not merit any consideration whatsoever. Sort of like
the olympics...

I always wanted a good Bluemax (not the fly diagonally, bomb and
strafe one), but the arcade vector graphics one. Similar vintage to
Battlezone. There was even a Bluemax 2....

RainbowWalker

Some of the neatest scrolling & color effects around. Granted its a
Qbert derivative, but it was always fun to play (still is...)

Archon 1 & 2

Best 2 person game around. My roommate and I spent hours playing both, plumbing the furthest extremities of human competition.

FA: Huge collection of Antic magazines

I have a huge collection of Antic magazines for auction. Many early, rare, and sought after issues are included. Some bound/hardcover volumes as well.

Prices range from cheap to reasonable. Will be adding more over the next few days..

The current auctions can be viewed at:

Hi Mike. My solution is not a utility for the Atari, but I am sure
you can find a PC with sound card somewhere. I wrote a set of
utilities to process .wav audio files. Put the tape in a standard
audio tape deck and hook it up to your sound card. Then record the
sound to a .wav file and then you can use my PC programs.

I have a program that will read the .wav file and produce the data
that is encoded on the tape in a .cas file. Even if the data is
damaged and won't load, the program will still be able to recover
portions, and at least you can try and make some sense out of the
damaged parts, to see what is on the tape, and if you would want to
recover it. Give it a try, the programs are free of charge! And if
you have a SIO2PC or APE cable, you can even load the tapes from your
PC without the need for a 410 recorder. My progams are at the Umich
archives, but also on my home page:
http://home.planet.nl/~ernest

Keep those Atari's buzzing.
Regards, Ernest.

As I've been looking into possibilities, of late, of acquiring an SIO2PC cable, I've been wondering about an option such as this. What kind of a program is PCXformer? And, is there a site on the net I could read about/ purchase the program? I, too, have an 850 interface... Are there any disadvantages to using the null-modem cable and the serial connection over using a SIO2PC connection? I'd assume SPEED *may* be an issue??

Message-ID: <39C6CE51.8BE78F0C@despamsucksja.com>
Source record: 41803

Oh yeah, one of my favorite subjects. Here goes:

Alternate Reality (City and Dungeon). Simply the best role playing game ever. System Shock 2 is the only game I have ever seen that comes close to the combination of feelings of desperation, immersive atmosphere, and sense of purpose. The fact that this series, and ARO, have been squelched is truly one of the biggest tragedies in video game history.

Star Raiders - Space combat the way it should be. It's just you vs. all of them. And you WILL win. Doggone Zylons.

Ali Baba/Return of Herakles: This was multiplayer co-op back in the days before Doom and Unreal Tournament. The chance to play characters of lore in fantastic situations was, and still is, unparalleled.

Jumpman: Before coins and toadstools and hedgehogs appeared in platformers, there was this wonderful game that combined platform jumping, ladder climbing, bullet avoiding fun with a dose of puzzle solving. Any guy who can defuse a bomb while falling on his head is ok in my book.

Ultima II: Another great role player that was actually quite sprawling for it's day. Remembering creeping around in those dungeons and towers late at night still gives me the heebie-jeebies.

Boulder Dash: This game always seemed like sheer insanity from beginning to end. And Rockford (I think that was his name) was the first character who seemed to have some real personality.

Pharaoh's Curse: Great, if somewhat simple, puzzle game. I used to wonder how that bat or buzzard or whatever it was could carry around full grown people (and a fully dead mummy), but such is not for us mortals to ponder, I guess.

Karateka: Game play was repetitive and almost boring, but it was one of the most fluid and best looking games at the time. And punching that evil bird into a cloud of feathers was pretty cool.

Archon: This is such an entertaining game that I didn't mind the fact that I usually got my butt beaten for the first few months I played it. Nailing a goblin square in the face with a unicorn bolt always made me feel better.

Those are probably my all around favorites. The "Apshai" games, Preppie, Picnic Paranoia, Repton, Bandits, Lode Runner, Choplifter, Caverns of Mars I and II, Bruce Lee, Shamus, and many, many more all have a special place in this game player's heart.

>picture files might be better....hmmm???? JPG?
>What format would be best anyone?

Awesome amount of work.

Do I understand it correctly. You've been using scanner, converting
them to text - ocr translation (i may be using wrong term - I have a
scanner but have never used the convert to text ability) - Do you have
to do much editing to get it into a decent format.

With .jpg, as I understand what you are saying, you'de have to
picture insert each scanned jpg page graphic into your pdf document
else you have a bunch of pages in separate .jpg files.

As long as the scan has a high enough resolution that you can read it
properly that would be adequate. I don't know how much more or less
space is involved.

Wish you had some hocus pocus. Where is Harry Potter when you need
him?

What about one of those nintendo-style game pads?

5985. Tuesday Night (19 Sep 00) Chat at #atari8 with topic Alternate Reality

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-18 03:46:29 UTC
From: DCM01@USA.NET
Message-ID: <39c48995.764178@news.CIS.DFN.DE>
Source record: 41777

This announces our weekly IRC chat for Atari 8bit enthusiasts.
It's scheduled for September 19th, 2000, 10:30 pm Eastern US
time.

Here are the corresponding times for some other
places, choose the one near you.

California: 7:30 pm. Colorado 8:30 pm. Texas 9:30 pm.
London, England: 4:30 AM. Berlin: 5:30 AM. Hong Kong:
11:30 AM.

The topic for the chat will be "Alternate Reality: Legend and
Legalities." I hope to get into an interesting discussion of the
copyrights involved. Should authors own their own work forever, or
should a software company with a contract get it, no matter what.

General Atari8 chat is also welcome. We awarded the doorprize last
week because we got 7 participants. Maybe we can get another doorprize
to award, but I need some help with the Atari quiz because the
questions should have been better thought-out last time, and there was
some controversy.

This will be a standard IRC chat. It is not a web-based
chat on your browser. You need an IRC client, such as
mIRC. The chat will be on Amiganet. Here are some
servers that will get you there:

irc.whiterose.net
thule.no.amiganet.org
linux.us.amiganet.org
au, uk, se, no & us.amiganet.org

Once you log onto a server type "/join #atari8" and we
will be there waiting for you I hope!

Jess, Yep, My site (url below) does have some manuals etc.

I've been very busy lately and havent had time to scan, or OCR
my remaining manuals. I have a large amount not online, due to
the web space required by scanned manuals. I do make these
available on cdrom along with huge amounts of ATR files (5000+),
please contact me for details if anyone is interested.

I have over several hundred manuals to scan, and had been scanning
them into Adobe Acrobat 4 (*.PDF), but I've kinda changed my
mind now as to what format to keep them in. I think individual
picture files might be better....hmmm???? JPG?
What format would be best anyone?
But as usual, it's always a factor of time, or lack thereof.

Anyone that has any manuals scanned that arent currently online,
and wish to donate them to Holmes Atari 8bit Archive. Feel free
to contact me.

Regards
Aaron aka.Holmes
http://homepages.ihug.co.nz/~aaronat/atari.html

PS - I'm looking for someone reliable with time on their hands to
take over the updating of Atari news on my site, and other things.
If you think you'd like to do it for at least 6 months, please let me
know.

Jessica C <beadsandbangles@earthlink.net> wrote in message

Hello Everybody,

I was wondering what your favorite Atari 8-bit
video game happens to be?

"Deluxe Invaders" by Roklan Corporation
(This was the BEST version of classic
"Space Invaders" for any Atari system.)

"Pac-Man" by DataSoft
(This was basically a retooling of the
Atari 8-bit version that added those
classic intermissions from the Atari
5200 SuperSystem.)

"Astro Chase" by First Star Software
(The most difficult to play yet graphically
pleasing science-fiction video game for
the Atari 8-bit computer system.)

Wally

Thank You Kevin and your great team for keeping this up for so long.
It is so hard to find Antic magazines now, And your webpages fill the
gaps in my collection, allowing access to those mags, I probably never
will ever find.
The effort gone into the archiving of Antic is very much appreciated
by myself, and I know it is appreciated by many others too.

Thanks again,

Aaron

> ... When you REALLY need one ...
>

> !
> >
> >Gork:
I haven't used SIO2PC because I have been too lazy to make
the cable and my setup works well.

I have a lot of older PC parts left from a former PC
repair and upgrade business (now moribund)

My setup consists of:

A 486 DX-66 PC,8megs ram,428meg HD,sound card,4xCD,
(Dos 6.22 only,no Windoze!)
and a 28.8k internal modem on COMM4
permanently connected by COMM2 to A: port of an AB
switch
A 9600k external modem connected to B: port of
the AB switch

The Atari 130XE is connected,by the 850 to the common
port of the AB switch.

I switch to B and connect to the 'Net,using a shell account from the
local library (the library provides
access with the Lynx browser)running OmniComm on the
Atari 8bit.I use OmniComm (I sometimes forget and call it
OmniTerm!)because Lynx requires VT100 emulation,
80 columns,and Kermit transfers.

I power down, switch to A,reboot,and transfer files
between the PC and the 8 bit using OmniComm on the 8bit and ProComm
on the PC.I transfer files using Kermit,to avoid the bit padding of

other protocols,
and because Kermit will do batch transfers.
(BTW-you must read the docs and customize OmniComm
for 9600k.)

You will need PCXformer 3.8 (available at
www.emulators.com)Be sure to E-mail Daerek Milhocka
thank him for making this GREAT program PD!
I suggest you get ARCE.COMM and ARCV.COM from the
U.MICH MS-DOS archive and should have IMAGEMAN.EXE
{but I can't remember from where :(}

This works great for me and save wear and tear on my
valued Atari hardware.The only problem so far,is that
I can't get SpartaDos to work {although Darek assures
me it will.Obviously operator error :(}

Good Luck! ......Ed

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

The box in which my Atari 800XL came had a note that it was:

"The Official Home Computer of the Olympics" (in 1984)

(Was that just pre-Tramiel and did he, as he did with so many contracts,
just blow that away when he took over Atari?)

Before you guys start reinventing the wheel, look at Tom Hunt's Desktop
Construction Set (DCS) at his site. IIRC cth.tzo.com under CC65 stuff I
believe (but it will run without the CC65 stuff)

There are so many other things we need first:

- fax software
- JPEG viewer
- and the rest of the cool stuff that has been done on the C64 (which runs at
almost half the speed of the Atari)

Source record: 41824

Can anyone offer some suggestions on Bounty Bob?

I have tried at least seven (7) different versions of it based on format and byte count with no success; some are boot .ATR's and others were load and go .EXE's. I have ported them to real 8-bits (800, 800XL, 800XL-XLBoss, 800XL-Omniview, 800XL-Omnimon, 800XL-FixXL - TransA -TransB -HomeMadeTrans) and most emulators (XL-it 0.20, XFormer 3.8, XFormer 2000, A800Dos, A800Win, RainbowW95), all to no avail.

I have been wanting to try Scraper Caper since playing Miner2049er in 1984 and I assume that Bounty Bob Strikes Back may be that sequel. What is its secret?

TIA

-Ron

I don't have a solution but I admire the problem.

>"w_a_lang" w_a_lang@willinet.net asked:

>I was wondering what your favorite Atari 8-bit video game happens to be?

Could never limit it to just one, most played were:

Lode Runner & Championship

JumpMan

Miner2049er

MrDo

BoulderDash

These all presented some form of puzzle to ponder mentally in addition to testing the joystick reflexes.

-Ron

I don't have a solution but I admire the problem.

Get...out. </seinfeld> :) This sounds like magic - thanks for the
great tip! Question: I have a good dual cassette deck, but I happen to
know that each player plays at a slightly different speed (and I think
that most cassette players are not 100% standard). Does this affect the
outcome of your programs? Also, what format are the resulting .cas
files (i.e. are they text? Something else?)

I don't have of those, but I'd like to echo the sentiment for Analog,
which ranked right up there as a top-notch Atari magazine for many, many
years. I have about half the collection myself (40-50 mags, and growing
through Ebay - my goal is to get them all) and a scanner, and would be
happy to help.

Hey Ron,

I have a solution, and I don't admire the problem.

here's how I got a copy to work:
First, you cannot boot the game from DOS, you need an appropriate loader.
You can use my copy of bounty bob if you like... its got a loader installed
and is all ready to go.
http://www.halcyon.com/danver/atari/BountyBob.zip
now, here's the trick for this version. The game will run only on an 800XL.
I have tested this ATR on Atari800Win 2.6c and it runs only in 800XL mode.
Also I have tested the code on real hardware, and it works only 800XLs (NOT
130XEs!!!). Anyhow, at least its consistent.
If anyone has a better idea, or a better version that works on 1200XLs and
130XEs, you better be following up this post.
see ya,
-Dan

>In short word: You need a DOS machine to use SIO2PC without errors. A DOS machine means pure DOS. My PC is a 486 machine with MS DOS 6.22 and SIO2PC works fine here...<

Just tried it, and 4.19 works fine using a Dos Window under W98 SE, at least as far as disk access goes (I've never used a modem under SIO2PC). I run a K62-500 on an ASUS P5A-B board. Evidently, relatively fast machines can do it. Actually, I'm not sure that 500 MHz is even "relatively fast" anymore! :-)

Way to go!

400 years from now, our descendants will load the data into their holograph machines, walking into a virtual room to pull a copy from the shelf of 88 mags. And the C64 crowd will just have to suffer 'cause all their magazines rotted!

On Mon, 18 Sep 2000 10:48:57 -0700, Kevin Savetz <savetz@northcoast.com> wrote:

Same thing ? No way! I think BD is much better than BDCS. I don't know what it is, but I feel both BD2 and BDCS is running slower than BD. At least the versions I have.

I just meant that the gameplay is vastly different. In the Miner
games, you jumped around platforms, slid down slides, jumped on
elevators, and grabbed various tools to kill baddies for a period of
time while collecting little things off the floor. It was all
relatively sedately paced and each level was one screen. In BBSB,
there are no tools or any way to kill the baddies (except the
"mushroom" things that appear from time to time out of the objects on
the floor that allow you to pass through them), there are no slides or
elevators, no ladders to climb, and the things you collect are on the
foor rather than in, and the game is vertically scrolling and extends
quite some way. (I've never made it down to the bottom... :-)

They just seem like two very different games with little in common
with each other besides the same author.

I think your thinking of a different game entirely, whose name
completely escapes me (damn fickle memory) where you start at the top
and work down through different screens, avoiding swooping 'things' and
an irritating spider that spins webs to slow you down... (Something to
do with diamonds? There was a very large one at the end - the whole
purpose is to get to it.)

BBSB is very, very like Miner, only on a much grander scale.

Mountain King, I presume?

I actually do need assistance with Miner 2049er. I can't make it past
the third screen. I can kill all the mutants and get all the floors
painted except for a bit in the center of the screen that you must
jump to. The jump is too far and BB dies.

Is there a way to use the elevators? I could not figure out how.

I do remember there was a jump you had to get perfectly, but this is
going back some (I haven't played this game since sometime in the 80s)

The number keys corresponding to the number on the transporters operate the transporters... Sorry if I'm not on the same wavelength, this is from memory...

Message-ID: <0rrhss82u2mg61fofend21eilhcuucgtu6@4ax.com>
Source record: 41717

Got a bidder from Germany who is interested in my atari system.
See http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=440791695

He cannot use the power supplies as is though. He will have to use his
own special power adapters to convert from 220v to the atari input
volt.

I think all I have to do is record what the atari power
characteristics are. I read

Computer 9 VAC, 15.3 VA
Disk Drive 9 VAC, 31 VA
Program Recorder -- standard us power cord is attached
Printer 9.5 VAC, 40 VA

Anything else he needs to know?

Attempted both several DOS's (option L & Autorun.sys) and a few of those
3-sector loaders...

>The game will run only on an 800XL.
>Also I have tested the code on real hardware, and it works only 800XLs
> (NOT 130XEs!!!)

Does that mean STOCK 800XL's? Mine has the 256 mod and is somewhat 130
compatible. Givin' it a try - thanks!

-Ron

I don't have a solution but I admire the problem.

I will have to check level 3; can't picture the center bit off the top of my
head...

The elevators work from the keyboard; get it and press the floor number (1,2,3)
up on your top row... zoom!

-Ron

I don't have a solution but I admire the problem.

I think they are better equiped to manage the necessary adapters over there
than we are in the US; voltages are easy - main thing is we are 60 cycle and I
believe they are 50! Plus the matter of the NTSC vs PAL Antic chip in the 800.
This time I really don't have the answer, but I still appreciate the challenge!

-Ron

I don't have a solution but I admire the problem.

Are you playing the same Bounty Bob Strikes Back as me ? Mine is almost identical to Miner 2049'er, except there's more to the jumping technique in BBSB than M2049'er, like jump right up and start moving the joystick when you want to time the jump for shorter jumps. M2049'er jump right up, left or right. My BBSB has sliders, ladders, baddies which can be killed with much of the same items as M2049'er. Please let me know what game you are talking about. Dan Strikes Back or something perhaps ?

Tape speed is not really important. Atari engineers also stated this
in all sorts of documentation. Anyway, everything you want to know
about tapes, and even everything that you do *not* want to know
about tapes is included in the documentation that comes with the
program. Also the 'C' source code is included.

The .cas file is some sort of special format, sort of similar to the
.ATR format, but different. There are no conversion tools yet, since
most people do not really need them. They could be written though.
I currently have little time to do so, and if nobody needs them real
bad, I will spend my time on other things.

Keep those XL's/XE's humming.
Regards, Ernest.

Ron...
sorry, but this version works on stock 800XLs only. I suspect it would work
on a stock 65XE as well, but have never tried. Probably the flaw in the
code is assuming a 64k memory size.

I made such a tool for gfa basic on the ST. Just take one of many
basic de-tokenizer programs and modify it. The names are missing
but the tokens are just numbers, which reference the names.
With a little modification you could easily have it generate
dummy names, like var1, var2, var3, str1$, str2$, and so
on. I also have a detokenizer for BASIC and TurboBasic I
wrote for the ST so I could port 8bit BASIC to the ST. At the time I
didn't think to have it detokenize protected listings. If you cannot get
it sorted, maybe I can unprotect for you and mail it back.

I totally agree with you, especially about J.D. Casten! He my favorite Antic game programmer. I never did finish Escape from Epsilon! And Max B. was very clever.

Anyone know what he's doing these days? I didn't see his name in the "Where are they now?" on the DAP site. I sure hope that he's working in the games industry somewhere. He sure had a talent for it!

You don't need to worry about Atari input voltages; all he needs is
a 220 to 110 volt converter to use the existing power supplies.
The Atari stuff doesn't care what goes into its power supplies, only
what comes out.

Unless (possibly) you're talking about a 800, the computer (XL/XE)
requires +5VDC at around 1.5 amps. Your disk drive spec sounds about
right and the printer will depend on the model--what you've quoted
will probably work with a 1027. But, I reiterate, North American power
supplies will work fine as long as your buyer has a 220 to 110 volt
transformer between the mains and the Atari PS'.

I don't know if i posted this. My post didn't seem to transmit
properly so if i am reposting i apologize,

He doesn't want me to ship the adapters. They weigh a lot. So doesn't
that mean he has to convert from his 220 volt or whatever they use in
Germany to Each Atari Device's power input requirements.

I'll be shipping him USPS parcel post. I gather there's a lot of paper
work. I've never done that before. But it is mailable. That's what
they tell me and he says it's much more expensive for him to ship to
us than it is for us to ship to him. (That is where by us I mean
those of us who live in the us and him being he who lives in Germany)

Hmmm...I would have to say:
1.)Jumpman (Epyx)
2.)The Nightmare (Epyx)
3.)Crypt of the Undead (Epyx)
4.)The Eidolon (Epyx)
5.)Hardball (?)

But, I'll tell you all what....I like WAY TOO MANY games on the 8 bit Atari.
These computers rely upon FUN GAMEPLAY rather than catchy graphics and
sounds. I don't know how many games I have bought for my win machine
because the caught my eye, only to realize that the game just isn't any fun.
Oh well, that's my 2 cents worth.
Steve.

Just about finished coding the re-lister program with NOTE & POINT and the 7 offsets in the top of the BASIC file; only remains the logic to rebuild a variable table when more than 26 are present...

Stumbled across an old TACE newsletter with an interesting idea in a really clumsily written program; it POKEs a deferred vertical blank interrupt routine into the bottom of the stack at 256 to 320, POKEs 764,255 and then LOADs the unLISTable file. The VBI looks for the Start key and then inserts the bytes for a new line 32768 into the locations referenced by (138-139); they are $00 $80 $06 $06 $21 $16 which deTokens to "32768 RAD". I haven't tested it yet, but it seemed rather brilliant; if you pressed "Start" after "Ready" appeared and before entering any commands at the keyboard, it should avoid lock-up and LIST. It would still be unreadable, however, if the variable name table is full of clear screen characters.

>someday. Well, it isn't really worth much, but it is still fun to play.

Shame about the PC version, which I actually bought. It had utterly
nothing to do with the original, except that you drove a tank and shot
things. Good game on its own merits, but it should never have been
associated with the original.

As much as I was never into strategy games that much, I loved these
two. The PC sequel to those two (Archon Ultima) kinda sucked, tho.

>Curator of the Digital Antic Project

Congrats! Antic was definitely my Atari resource way back. I did buy
Analog from time to time, but Antic had that warm 'n fuzzy feel to it
that Analog lacked, and it had game type-ins that were much more fun.
Particularily those by J.D. Castin -- Rebound was probably the best
type-in I spent hours doing, followed by its construction set. I had
loads of fun with those...

Then there was mini-golf and its construction set... ah, the memories.
:-)

Actually, BBSB is nothing to do with the Miner games -- at least, it
doesn't appear to have much in common with them, other than that you
have to wander about collecting "treasures" (?) and avoiding various
baddies. You don't even play the same character. It's still a very
fun game, though; fast-paced. i've had no trouble getting it to work
under Atari800Win and XL-It!.

He may have told you 4-6 weeks but once it leaves the US the package is out of their hands and they have NO control over the package. I just mailed a monitor from CA to MA thru USPS they told me 8 days Im on day 11 and the monitor has yet to be received. And mind you this is in the US.

>
>
> I asked ups and they can't handle used equipment.

Ive been told this too but, Ive sent used computers thru UPS with out problems. Well there was the on time they broke a 19" Atari monitor I sent to Canada. Seems Canadian Customs likes to open up packages.

>
>
> For 40lbs that is $50 for surface and $100 for air
> Not bad really

Not bad for us but, you need to do the conversion. $20 cheaper than it was to Austria.

Paper work is really not that much its one sheet if using USPS. UPS is the one with all the paper work. Also watch the gerth of the package as it only can be 108" if its over that the price goes UP.

Escape was an excellent game, too, and another I enjoyed immensely.
He may have used redefined character sets, but his games *always* had
fantastic gameplay -- and replay value. I played Rebound not too long
ago, and for the first time in may years, and it seems my reflexes
have slowed down since the first time I played them, 'cos frankly, I
suck at that game, now. :-) But it's still lots of fun.

Another of my favourites was Uncle Henry's Nuclear Waste Dump, which I
thought was really very clever. I was working on an updated ST
version of that years ago. I got as far as having done all of the
graphics, animations, and some basic code down for displaying things
and moving the crane around before I unfortunately left the ST scene.
I'd still like to remake it, though...

>Anyone know what he's doing these days? I didn't see his name in the "Where
>are they now?" on the DAP site. I sure hope that he's working in the games
>industry somewhere. He sure had a talent for it!

It's funny, but I seem to recall hearing something years ago, but I
can't remember what. (my mind, as well as my reflexes, has degraded
since then, too. :-)

Message-ID: <MPG.1433d503fb2a0acf9897e6@news.prodigy.net>
Source record: 41737

The starting bid on this item is $4. I have listed it before and received no bids, so if you want it, it appears there is a good chance you could win it for the minimum bid.

There is more info, including pics, video input pinouts, etc. in the listing at eBay:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=444453112

I thought this item might be of interest to XEP80 owners as it is a MONOCHROME multisync monitor that handles either composite or TTL input. Use you XEP80 in composite mode, and get a view on a larger than average monochrome screen. If you use or have used the TTL XEP80 conversion published in Atari Classics, you can use the monitor's TTL input for a sharper picture.

For those of you who may also have an Atari ST, TT, Falcon, Amiga, or other system, this monitor handles 15 - 36KHz scan rates, and supports TTL (MDA/CGA/EGA) and analog signals. Both a DB-9 (for TTL modes) and HDB-15 (for VGA) cables are included.

Cynthia,

I hate to burst your bubble but, shipping to Germany is not cheap. That package your going to send we most likely cost about $150 USD thru UPS and about $100USD thru USPS. So I hope you have told the guy the weight of the package and the cost. This usually changes their mind really quick. Ive done this several times on Ebay. The last one I sent to Austria cost $70 thru USPS but, it took 7 weeks for delivery and it was only 2-800s nothing else.

This package including the auction will cost the guy over $550 DM. So I would be sure to tell him the shipping costs.

Don

Ron,

I have tested this version of BBSB on a stock NTSC 800XL and it works perfectly.

However, I did try it on another 800XL I have with a Rambo upgrade and the game crashed during loading. It does the same thing with my 130XE. Sorry, but I don't have any PAL machines to test it.

-Dan

he typed:

>Good grief....DSB mistaken for BBSB!!!
>
>Nurse, take this person to a secure installation!!

Yeah, I know. The name's what threw me off. DSB was one of those
games I played frequently, while the Miner games didn't see a lot of
play from me on the 8-bit, so DSB sticks in my mind more readily. :-)

Nuh uh!! Here are the facts.

References:
http://pe.usps.gov/cpim/ftp/manuals/imm/immicl/immicleg.pdf (See
page 57)

See also
http://www.usps.gov/cpim/ftp/pubs/pub51.pdf (Page 32)

My post master told me 1 week for air parcel post, 4-6 weeks surface
parcel post to Germany.

I asked ups and they can't handle used equipment.

For 40lbs that is $50 for surface and $100 for air
Not bad really

I sent him this page and told him what my post master told me but if
you think my post master was clueless about times perhaps I should
call another local post master.

Tell me what am i missing beside a lot of paper work?

>the package and the cost. This usually changes their mind really quick.

One project I've been thinking about for years but never got
started is porting Fortress ( the SSI game, not the shareware one )
and/or Rails West to the ST. One of the reasons why I never
started was the need to unprotect them first. You think your
utility could take me over this first step ?

Gerhard

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Look, you could do it easy on the PC. Using my ADIR utility you can
extract 'BUILD' file from the ATR image. Using my CHKBAS utility you can
produce the basic source.

6088. unloading stuff at nyc flea market

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-22 00:00:00 UTC
From: Paul <trailblazer@usadaughtcom>
Message-ID: <6somsssbn4e4bl9fhkvg74d05midi1nbb4@4ax.com>
Source record: 41657

I'll be unloading a few atari computers, as well as several vintage
game systems and accessories at the Greenflea flea market this Sunday.
It's at 77th and Columbus in Manhattan.

This is stuff that would sell on eBay, but it's nothing incredibly
rare or exciting. If you're new to collecting this stuff and want to
save on shipping, here' s what I've got...

I'm pretty sure I have the following systems:

800
800xl
600xl
1200xl

printer, disk drive, trackball, cabling.

I also have some other old computers, and several game systems
(including about a dozen atari game systems).

Not sure if everything works, I'm trying to get the stuff tested this
week. I've got a monitor and electricity at the flea market, so I'll
also have the ability to test stuff there too.

If you happen to be in the area on Sunday, stop by and say hi.

Thanks,

Paul

Ben, you keep making commercial posts to a non commercial newsgroup. The frequency is extremely high, about once a week, but the 3 separate posts is borderline spamming. Could you please combine the 3 posts a week into a single post?

6090. Re: Tape to disk?

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-22 00:00:00 UTC
From: carmel_andrews@my-deja.com
Message-ID: <8qg571$c7b$1@nnrp1.deja.com>
Source record: 41659

Heelo there Ernest, hows the Atari thang going, Keep those Atari's humming, thats what i say

Anyway: re, Tape to disk:

If the originator of this posting still has access to real 8bit h/w and tapes/disks, just tell him to use a proggie called howfendos v3.8 or 4.0, and howfen tape to disk... Alternately s/he can use Transdisk xl or Transdisk4 xe, to convert single/multi stage tapes to disk (unfortunately these proggies only read standard load, they cannot read files like EA, English Software and certain Ocean/Imagine titles, in other words any boot tapes that refer to dcb usage i.e 300h-30bh, and not iocb usage which is normally 34xh, 35xh, or 38xh, these are the standard iocb areas that standard boot tapes uses

If the originator of this posting uses built in omnimon with the a8, jsut load in the loader routine as soon as it load the first record of the main program (which follows the loader) hold down select or option select and then press reset, and provided the machine hasn't vectored to coldstart routine you should be able to start scanning different areas of RAM, just start scanning from 400h for 60h (which if memory serves me right is the ml code for jmp i think, but look for the first jmp instruction from 400h on, and back track till the first used byte of ram,]this is where the loader sits in ram, just do a scan for either the iocb location as indicated above/ or do a scan for 308/309h, if 308/9h shows nothing then the program uses iocb, if not it uses dcb load the usable area of ram for scanning is usually 400h to bfffh

Anyway once he/she has converted the tape prog to disk (a8) just use anadisk/deanna or the software that comes with sio-pc/ape pro s/w to convert the a8 disk to pc atr format (which is used on all pop. a8 emulators incl. M.E.S.S)

If are trying to convert non standard boot tapes (anything that uses dcb vectors) the only programs i know of that will handle this type are either The Impossible (CSS), The Freezer (Digicomm), The Freezer (German s/w), Taskmaster (DGS/Rambit) or if you have the os controller card, a h/w upgrade for xl/xe or qmeg/speedy os (qmeg/speedy o/s has a built in c.sim s/w) the os controller card had a program with it called superdump and superdump 4, basically it allowed you to dump up to 48k to boot disk, regardless of tape format (standard/ non stnd'd, basic & ML,etc)

Once you have converted to disk, please refer to converting a8 disk to pc

I Hope this helps

Happy Atari'ng

You know what, I think. Old Atari prices will only go up. It was a
classic in the beginning of personal computers. There is a lot of
facinating history and it worked extremely well.

Well gfa-basic for the ST was coded by the same author who
made turbo-basic. I have made a tool to unproctect gfa
listing as they are protected exactly the same way, in fact
the var names are missing, and they auto run when loaded into
the gfa editor. If you stop them, you get a screen full
garbage which cannot be edited.

I have a BASIC/TurboBasic detokenizer that I can probably
tweak for that purpose, given a little time. It's been a
while since I've messed with the stuff. All I can say
is I am willing to give it a try.

If that will work on protected programs, it sounds like
good idea.

I don't remember saying all that. But I do remember saying that Windows likes to interfere with serial programs (not just SIO2PC) when they are running in a DOS window. Windows 3.1 would allow you to give the DOS program highest priority and that helped. I don't W95 would allow that. I don't know about W98. I do think SIO2PC runs best in DOS, but it doesn't have to be an old version of DOS--with the newer versions of Windows, you can typically run (start up) in DOS mode and SIO2PC will be OK.

I don't think it has anything to do with drivers. Windows likes to time slice and steal time from running applications. When SIO2PC is running in a box and there's no keyboard activity going on, Windows figures the application must not be doing much of anything so it steals more of its time, enough to make serial communicaions at 19.2 KB impossible. I've actually been able to make SIO2PC run OK in a DOS box by banging on keys (ones with no function associated). That seemed to keep windows at bay.

Regards,

Nick Kennedy
SIO2PC Programmer

The IBM method of madness only works because selectable drives are shipped with their jumpers set to be the second drive (drive b). The twist causes a reversing of the signal such that the drive plugged onto the end connector responds as the first drive (drive a).

The jumper block for drive selection is usually four pairs of pins right next to the 34 pin connector. They are usually numbered 0-3 indicating drive 1-4 or a-d, but ATR might have had a better idea than IBM and used their own scheme which means - try it till it works. Best of luck.

Hi Paul. I am really interested, particularly in the Atari game
systems. I've got a couple of 800's and 800XL's at the moment, so what
I'm looking for is a 6-switch 2600 w/ a power supply. The trouble is
I will be in Philly on Sunday, so I was excited and disapointed at the
same time when I read your post. Anyway, I live on the Upper West Side,
so please let me know if you intend to visit the flea market again. Or,
if you have anything left over, let me know if you would still like to
sell. Thanx, Mike (burkhart@phri.nyu.edu)

Message-ID: <20000923123127.02569.00000414@ng-bg1.aol.com>
Source record: 41675

Completed coding and testing of the re-lister program with NOTE & POINT and the 7 offsets in the top of the unLISTable BASIC file. This BASIC program patches a copy of the unlistable program directly on a diskette; it corrects the zero line length lock-up and, if necessary, re-constructs a variable name table in minimal space which will not encroach on other data. It puts in a single letter up to 26 numerics, arrays or strings and then it goes to double letters (AA, AB, AC...) for each as far as they need to go. You can then use a text processor on a LISTed copy to replace the variables with meaningful names like FILE$ and SCORES(.

Anyone interested in having it, just make it known. Also, where can we put it that will be available to others when needed? Who controls the archives? Maybe we can convince Dr Clu to put it in the download section of his JYBOLAC bbs.

ATTENTION RETROGAMERS, COMPUTER COLLECTORS, VIDEO GAME FANATICS!!!!

WE'RE BACK!!..

CCAG 2001
(Classic Computer and Gaming 2001)

If you like collecting old computers, video games, and enjoy using them
still, then come join us on:

June 23rd, 2001
9AM till 6PM

National Guard Armory
IT'S ON ROUTE 57!!!

(actual address)
3520 Grove Avenue
Lorain, Ohio 44055-2048
(On Route 57, going North of I-90/Route 2)

IT'S FREE!

Both vendors and attendees!
Computer User Groups and vendors inside, flea market outside!

Setup: 22nd, June, 2001
6PM-10PM

Please Call Ahead for Reservations:

Jim W. Krych jwkrych@n2net.net
440-979-9295
Fred M. Horvat fmh@netzero.net
440-286-2566
And these other CCAG 2001 organizers:
Thomas J. McLaren sirthomas@uk2.net

Please visit this site:
http://tomheroes.com/ccag.htm

As of 9/22/2000
User Groups:
Erie PA Atari Group
TI Chips
Cleveland Classic Atari Group

Vendors:
Tomorrow's Heroes
Retropolis
Songbird Productions
Video Game Connection
Ramcharged Computers

People/Organizations:
Thomas Mclaren
Andy Frueh
Tim Snider
Curt Vendel(Atari Historical Society)

We are looking to do a "Classic Game Experience" this year!
One room is going to be set up for playing classic computer and video game cartoons and commercials. The other room is going to be an emulator room-MAME, etc. We are hoping for some people with arcade systems to bring them-will probably need a small generator for that.

See ya at the CCAG!

First the encouraging news, Brad Koda of Best Electronics http://www.best-electronics-ca.com/ (a really great guy!) directed me to a fellow in San Jose with some knowledge of the ATR8000. We are attempting to diagnose it via email and only time will tell; he does the thinking and I do some poking around.

Now the questions; I am currently using a Percom master drive to control the old ATR generic 360 floppies. These old PC refugees have little jumpers to set the drive numbers, but I have a slightly newer 5+1/4 which has not yet presented an easily locatable drive selector device. How could I use this drive as a slave to the ATR or the Percom with control over drive number, and how do the PC's use that little twist in part of the cable to configure their drive designation?

TIA

-Ron

i don't usually post in this group because i don't collect atari computers, i'm a video game guy basically. i was at goodwill today and i found box full of atari educational tapes. there were at least a dozen boxes, many of them still shrinkwrapped on subjects such as basic electronics, history and statistics. if any of you collect these send me an email and we can work out a trade or something. i picked up the educational system master cart and a few manuals plus a copy of atari connection (spring 83). i also found a big atari power brick (part no. co 61982).
all of these items are up for trade.
thanks

Hi,

I tried this version below and it works fine.

The only thing is, once I make it to level 6 (Grain Elevators),
the emulator does crash :-(((((((and I have to restart the
ATARI.

These "elevators" do not appear in levels before, so I guess
that is the reason for the crash. I assume that a player or
or missiles are used for the elevator, but I cannot imagine,
that this should really be a problem, because that games
uses them for Bob, the birds and so on in other parts, which
do not crash.

Any idea how to track down that problem ? If somebody needs
help to get to level 6, please let me know.

BTW I have my old PAL 800XL with 320KB and the disk I
have does work on it w/o any problem and the game does not
crash at all; a friend of mine made it through all levels.

Big clue here. Perhaps BBSB Playes around with bits in PORTB that it
shouldn't, ie enable extra ram and the code that was there is suddenly
gone.

In fact, each drive has 2 motor on's and 2 drive selects. ordered
something like this.
MO2, DS1,DS2,MO1. where the twist part is. as you can see. Twisting
the cable will use
a different set of MO and DS. Anything after the twist will be drive
A. Therefore, you
cannot place 2 drives before or after the twist, One must be each side
of the twist. Only
2 drives can be used this way. Most if not all drives these days do
not have jumpers on
them. A lot of older drives must be jumpered to D1 (D2 depending on
where it starts counting from) Pin 34 does something as well. Must
find out.

Teac probably still has this info on its web site. I was there recently.

I was working with a donated '486 at my volunteer site when a 3.5" floppy
came out of an Epson "combo" drive with half of its label torn off and
subsequent floppies put into the drive wouldn't work. I called my MIS and
he said that he had another combo drive, removed from another donated '486
of the same vintage. But this drive was a Teac (although older, it had
much better construction than the Epson, I must say!) Try as I could,
though, I couldn't get Windows 95 to recognize both the 5.25" and 3.5" units
in the drive. So, I took it home, logged on to Teac's site, plugged in the
model and serial numbers, and got what I needed to set the _JUMPERS_ (yes,
it had them!) properly. That Teac site really went back a long time. You
should be able to find the info you need there.

BTW, I also took the Epson drive apart and got that piece of label out.
It's now also back in service.

Yes but since the ATR is natively set up to hand 4 drives w/o a twist. IMO:
Better off just biting the bullet and not trying to do a lot of custom work.

When I first set mine up with two drives, I just removed the connector from
an IBM type drive cable and put it back on before the cut/twist.

When I moved to 4 drives it was in a box that was set up for 2X2 side by
side drives, so I couldn't find a cable long enough and ended up making one
up. It couldn't have been much easier, just ~3' of 34 conductor ribbon cable
and five 34 pin edge card connectors.

6114. speech synthesiser for atari 8-bit

Hi all, it's been a long while since i posted in here. I'm looking for a speech synthesiser for the atari 8-bit systems, I believe it was called the speech box or something, and it was produced by a company called Alien Group. I was corresponding with one of you quite a while back who had one of these and was willing to part with it, however my isp decided to terminate my unix account without warning so I lost the email address. In any case, if anyone has one of these and is willing to part with it let me know.

Best regards,

Tom

I'm getting rid of my ST stuff. If nobody wants it in about
two weeks, it goes out to trash.
I don't want to ship it. It is too heavy and probably I
wouldn't get enough to cover my costs and trouble.
If anyone wants to pick the stuff up, they're welcome to it.
I have a 1 meg 520 ST, a stock 520 ST, both work. Two dbl.
sided floppy drives, one doesn't work. Some single sided
drives that I think work. Two SC1224 monitors, both work.
Some software and books. All power supplies and cables.
One ST mouse, it works. If you want ALL this stuff, and can
make a time to pick it up, it's yours. I'm in the Cleveland,
Ohio area.

You know what annoys me? I was building a PC from spare parts I had lying around, and I couldn't get the 3.5 floppy to work. Turns out, my 2 floppy drives had some pins missing which were missing so that you couldn't put the cable in backwards I guess. But my floppy and IDE card wanted ALL the pins there, including in the cable (my cables also had a pin or 2 blocked out). The cables and drives even had their own different cables with blocked out pins, like pin 3 could be blocked out or pin 2. I had to eventually take out the floppy cable from my newer computer (I had put in a 5.25 with a older cable) and stick it in the other PC. I guess they changed industry standards in the middle 90's and started blocking out different pins on the drives and cables, so that idiots making a computer wouldn't have to do the process of elimination when installing floppys.

If you don't get a suggestion here, try comp.dsp since that is where they live. You may have to specify basic vs C, but I am sure there is someone there that has done it.

BTW: Paddles are only updated at 60 Hz, so you will get more then a bit of noise if your signal is anywhere near 30 Hz. You may need to put the pots in their fast scan mode.

I never did have a manual when the ATR8000 was alive, but I found one ocr'd online; its cable is described as follows:

1. Ground 18. Direction Select
2. N.C. (3.5" 1.44meg det) 19. gnd
3. gnd 20. Step
4. N.C. (poss. 3.5" 2.88meg det) 21. gnd
5. gnd 22. Write Data
6. Drive Sel 4 23. gnd
7. gnd 24. Write Gate
8. Index 25. gnd
9. gnd 26. Track 00
10. Drive Sel 1 27. gnd
11. gnd 28. Write Protect
12. Drive Sel 2 29. gnd
13. gnd 30. Read Data
14. Drive Sel 3 31. gnd
15. gnd 32. Side Sel
16. Motor On 33. gnd
17. gnd 34. N.C.

The Percom Master must be the same, because it controls the drive identically except for some things like 80 track and double sided capability.

Thanks to all who responded; the drive was an '88 Teac FD-55BR-100-U and I found the little jumpers on the bottom, in the back, partially obscured by the power connection, D0 thru D3. Does anyone know what the "U0" - "U1" jumpers do?

According to the pin-out above, twisting #10 thru #16 would swap Drive 1 select with Motor on and Drive 2 select with Drive 3 select so the PC must route differently.

-Ron

I don't have a solution but I admire the problem.

I've installed the card drive on my PC, but win95 insists on
making it another hard drive partition, only 128K. Doesn't
recognize card changes. Anything I can do to change the device
type, or make win95 ignore it? DOS treats it the same as win95.

Thanks for any suggestions.

To respond to this message, please use the enclosed email address rather than your reply button. Dealer enquiries are welcome.

Last Updated 09/24/00
- Sold/traded items removed

I have the following Atari Manuals, Books, Magazines and Comics (which are all in good to mint condition) which I am looking to sell or trade. If you have any questions in regards to style. language, or cover art, etc., please feel free to ask. I am open to reasonable offers, please make all offers in U.S. Funds (buyer pays shipping). I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please respond to me by using this link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Books (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

This list covers the following categories:
- Atari Force Comics
- Atari 2600 Manuals
- Atari 8bit Books and Manuals
- Atari ST Books and Manuals
- Atari related Magazines

Atari Force Comics
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #9 - September 84
- Issue #11 - November 84
- Special Issue #1 - 1986

Atari 2600 Game Manuals Please make an offer
==========
- Artillery Dual by XONOX - Full color French (Canadian) variation 1983 (rare)
- Asteroids - Full color 5 language variation 1979
- Atari Game Catalog (49 Games) Full Color English variation 1982 -Breakout - Full color 5 language variation 1978

- Centipede - Full color 5 language variation 1982
- Chuck Norris Superkicks by XONOX - Full color French (Canadian) variation 1983 (rare)
- Combat - Full color 5 language variation 1978
- E.T. - Full color 5 language variation 1982
- Jungle Hunt - Full color English variation 1983
- Kangaroo - Full color 5 language variation 1983
- Maze Craze - Full color English variation 1978
- Missile Command - Full color 5 language variation 1980
- Mouse Trap by Coleco - 3 color English/French (Canadian) variation 1982 -Night Driver - Full color English variation 1980
- Outlaw - Full color English/French (Canadian) variation 1978
- Outlaw - Full color English variation 1978
- Pole Position - Full color 5 language variation 1983
- Popeye by Parker Bros. - 3 color English variation 1983
- RealSports Baseball - Full color 5 language variation 1982
- Star Raiders - Full color English variation 1982
- Street Racer - Full color 5 language variation 1978
- Yars' Revenge - Full color 5 language variation 1981
- Yars' Revenge - Full color English variation 1982

8-Bit Books Please make an offer
==========
- Compute's "The Atari Basic Source Book"
- Atari Basic Reference Manual

ST Books Please make an offer
==========
- Atari ST Volume One VDI
- Atari ST Volume Two AES
- Atari Volume Three TOS
- Atari ST GEM Programmers Reference
- Atari ST Tips & Tricks
- Atari ST Internals
- Programmers Guide to GEM
- MC68040 32-Bit Microprocessor Users Manual - by Motorola
- MC68000 8/16/32-Bit Microprocessor Users Manual (eighth edition) - by Motorola

Manuals/Tech Guides (software status specified) Please make an offer
==========
The majority of the ST/TT manuals are of the binder variety
- Micro C Shell - by Beckemeyer Devlopment Tools (without software)
- LDW Power Spreadsheet - by Logical Design Works (without software)
- Superbase Personal - by Precision Software (without software)
- dBMan - by Atari (without software)
- 1st Word Plus - by Electric Distribution (without software)
- HyperPaint - by Atari (without software)
- Easy Draw - by Migraph (without software)
- Regent Base/ Regent Base 2 - by Regent (without software)
- Publishing Partner Professional / PageStream -by Soft Logic (without

software)
- Publishing Partner - by Soft Logic (without software)
- Touch-Up - by Migraph (without software)
- Microsoft Write - by Atari (without software)
- Codekeys The Macro Tool - by CodeHead Software (without software)
- Degas Elite - by Intregal Sollutions (without software)
- Brataccas - by Psygnosis (without software)

Electronic Games Magazine memorabilia Please make an offer
==========
- Order Form Insert (Vectrex Version) - Mint Condition. This was the original full color order form insert that was packaged in with many companies cartridges to help promote sales of 'Electronic Games' magazine. It is a three page foldout which covers all the regular articles that 'Electronics Games' ran. The front cover is purple and offers Vectrex players a 44% discount.

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- An original Intellivision keyboard for the original Intellivision
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

From PCBuyers.com (http://www.pcbuyersguide.com/)
We recently saw an article elsewhere that claimed Windows Millennium Edition "does away entirely with DOS underpinnings."

It is our opinion that DOS still lurks behind the scenes but is better hidden than before. Our research, as noted noted in our "Millennium and Beyond" review http://pcbuyersguide.com/software/system/MS-Millennium.html suggests a more accurate description is that "it retains the drawbacks of its DOS legacy, but, for the first time in a Windows 9x product, hides them from the user."

After all, there's already a third-party hack out there (actually, we've seen more than one!) that re-enables real mode boot functionality in WinMe. This patch http://www.geocities.com/mfd4life_2000/ enables DOS mode straight from boot via the F8 key. Doesn't this essentially disprove the "no DOS underpinnings" claim? (See the Forum http://216.232.19.173/ubb/Forum1/HTML/000004.html for other commentaries on bogus claims.)

The Greenflea market in Manhattan is not a place to sell/buy
electronic goods--vendors cater to the predominately female and
middle-aged antique-hunting-type crowd.

I'll give the flea market thing one more try. This Sunday on October
1, I'll be at the Elephant's Trunk flea market just north of Danbury,
CT. I visit this one at least once a month. It's a great place for
vintage electronics, and it's also the biggest flea market in CT.

Thanks,

Paul

6133. My new web site

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-25 00:00:00 UTC
From: Glenn Bruner <brunergs@pcisys.net>
Message-ID: <39CF54BD.D5830ED1@pcisys.net>
Source record: 41606
Cross-posted to: comp.sys.atari.8bit,alt.atari-jaguar.discussion

Hello Fellow Atari Owners,

Just wanted to share my new web site that I posted yesterday. It's devoted to Jaguar and
the Atari 1400XL/1450XLD. It was previously known as Images of Rare Prototypes... at
http://www.pcisys.net/~brunergs/Atari. My website needed a major overhaul and better content.
Plus, my new site out grew my ISP's allowed space of 2MB's. Thank you Geocities!

The Jaguar content talks about the different development systems Atari had for the Jaguar.
Included is a schematic I drew of the memory circuit of the Alpine board which has information
on the mysterious jumpers used on the Alpine. Also a nice schematic of the joypad and pin out
diagram for the cartridge connector that I got from the DoIt PROFIJAG archive.

The 1400XL/1450XLD content talks about the 1400XL and 1450XLD that I have in my
possession and what I've learned about them. The 1450XLD has schematics that I hand
drawn of various parts of the system (MMU circuits, disk drive, speech, modem, sound, memory).
This relates to the TONG (Hong Kong design) motherboard and not the generic 1400/1450XL
motherboard.

The site is located at http://www.geocities.com/glenn_b18.

It is pretty slow at first to load up if you have only a 28.8 connection. But I feel the content is
worth the wait.

Regards,
Glenn Bruner
brunergs@pcisys.net

I don't think that jap 2600 was real. To the best of my knowledge,
the one on the page listed in the previous message is the only actual
portable 2600 anyone's ever actually followed through with. I read
once about someone who'd planned to gut a TurboExpress unit and put
2600 innards in it, but I don't know if this was ever carried out.
This portable however is a very cool idea indeed. I'm thinking he
could make some good money if he ever figured out a way to buy the
parts raw instead of pillaging them from old hardware and making units
for people.

He says he spent ~$200 for it and $150 of that was for the portable TV that he uses for his display. I think that may be a bit high for most peoples' tastes. Last time I looked, you could still get Lynx for ~$50 so spending 4x that much for a VCS may be to much.

Does kind of suggest what the portable TV manufacturers should do. As long as they are doing a portable hand held TV, they might as well bundle it with some type of built in game system under the hood.

AFAIK, there are no CMOS 6507s. I imagine you could do it with a 65C02 and other CMOS parts.

6140. 5-1/4" DS/DD Disks

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-25 00:00:00 UTC
From: llpwhite@cs.com
Message-ID: <20000925133214.01006.00000738@ng-fp1.news.cs.com>
Source record: 41613

I indicated about a week or so ago that I would do some research on sources for 5-1/4" disks. This is not a final report, but the situation is really pretty good so here is a brief update. Both Imation (3M) and Maxell indicate that they still manufacture 5-1/4 DS/DD diskettes. No major manufacturer of disks that I checked shows this product on their web site, but several still make or sell them.
Verbatim has an on-line store that does list them for sale. A retailer that I have used before has plenty of bulk disks: http://www.mediasourceinc.com/
I checked several other disk sellers that show that they have plenty. The "clock may be ticking", but for now there seems to be plenty of 5-1/4's.

The TV Boy is a 2600 clone which contains 127 games. The unit I have
requires a TV though and I have never seen one of these units with a
built in monitor. However, as it already includes a joypad and a menu
to select 127 games, it would be a great start for a handheld project.

FamilyNet HQ: Telnet:\\www.family-bbs.net

In the realm of the Newton MessagePad I am currently working on making various apps to give the Newton more of an Atari touch. And of course I am putting these on my Atari/Newton Connection site when I'm done.

Having established various connection programs for those two computers to talk to each other, I am now working on MUSIC!

The Newton has a Modplayer. It works great but the Mod files need to be altered slightly to work with the player. I have a way now of doing this quickly (Thanks to the creator of the Modplayer and the creator of the Newton webbrowser), so now I need MODS!!!

So please, if you know of some good mods that are from Atari games, remakes of sounds from Atari games, etc, please let me know, and let me know where to find them. I'll convert them, and bring that Atari flair to the Newton platform!

Thanks in advance!

To respond to this message, please use the enclosed email address rather than your reply button. Dealer enquiries are welcome.

- Last Updated 09/24/00
- Sold items removed

I have a limited amount of brand new Atari Jaguar items for sale or trade (these are not refurbished units). These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25 - Only a couple left

** Atari Jaguar Accessories - New**
==========
- Team Tap (4 Player adapter) $20 - 2 units left
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $10
- RF Switch Box $5

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- An original Intellivision keyboard for the original Intellivision
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

6149. APE, SIO2PC and WIN ME

Newsgroup: comp.sys.atari.8bit

Installed WIN ME today, and proceeded to briefly check out APE 95/98, APE 118, and SIO2PC 4.19. The two APE programs work great, but SIO2PC 4.19 only works intermittently. I may try to play around with the timings to see if I can get it going. I wonder if it used the DSR line if it would do better? WIN 98 SE did just fine with 4.19, but not WIN ME. This was a DOS window. I'm not sure that ME has a boot-up DOS mode like 98. It does not have a "Restart in DOS mode" menu item as did 95 & 98

the male RCA plug coming out the back of the 800 is not composite video, rather it is RF. To use your monitor, you will have to have either a special monitor cable that plugs into the DIN plug on the side of the machine, or run the RF through a converter of some kind with comp. video output (such as a VCR).

FamilyNet HQ: Telnet:\\www.family-bbs.net

Just a message letting you guys see the results so far of the contributions and suggestions. BTW, this site has a two fold purpose... to house Newton mod files, but also give people in the Atari realm an idea of where to find (and house) Atari mods to play on their machines.

The original Mule.mod file will be placed on there tomorrow. ;)

Thanks for the entries so far! Please keep 'em coming!

Doctor Clu

@>-->----------

This is just a message announcing the fact that I have gone nuts with my latest project. Thanks to Steve Weyer's latest version of "Newt's Cape" and Roger Milne's "ModSaver" the Newton community now has yet another batch of mods to enjoy of their modplayers!

All this stems from the fact that I like my Newton having a certain Atari flair (What is an Atari fan supposed to use for a palmtop? A Portfolio?!? Yeh right!) and the desire to have some Atari media on there. And it is my hope to get an extensive Atari collection together at the site found at:

The ATARI / NEWTON CONNECTION
http://www.geocities.com/lady-aramis/newtonconnect.html

Just look under the Modplayer entry on the page and you'll see the link to the Mod files.

Check it out and let me know what you think!

Atari/Newton fan,

Doctor Clu

I have heard one or two renditions of the MULE theme in my time, but they NEVER were able to even come CLOSE to the original music. A 6502/POKEY emulator would be the best bet. Isn't there such a beast available for PCs, like the SID player for C64 binary music files?? I THINK I have seen one for Atari files, too.

Bye,
Thomas

6164. Atari 800 Question/Booting Eastern Front HELP

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-26 00:00:00 UTC
From: jamurphy3@my-deja.com
Message-ID: <8qq6pc$f39$1@nnrp1.deja.com>
Source record: 41635

Always wanted to play this game, got a used Atari 800 (original, not XL brown case) and a cartridge. Seated securly cartridge in left slot,have the 800 connected to a RCA video connector on a Commodore 1084s monitor (which works fine with a Apple][). When I turn it on I see a power light but no video.

FYI the 800 has 48K, no joystick or basic cartridge. Are those required for the game to load? I know game needs a joystick to play.

Never booted a 800 before FYI and I know nothing about them... gonna grab a 8bit Atari book today and RTFM but until I find one HELP!

Thanks

Joe

Theres also a portable Famicom (Japanese NES). Its called the Game Axe, its
pretty cool looking.

True, nothing comes close to a good ole pokey-fied version of Archon/MULE...
I have thought it would be great to have a AMS player for the PC or something
like it.

At any rate, since the Newton doesn't have such a thing yet, Mods will have
to do.. for now! ;)

Yes, Sid play or Playsid offer easy play of the original C64 music
which isn't that different to the Atari version or mods of all sorts
are available here..

http://inet.uni2.dk/~bluenine/c64mod.html

Ignore the C64 bit, they are hand made mods..

6168. Chat Tonight (Tuesday 26th Sep.) #atari8, on Graphics & BBK Artist

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-26 00:00:00 UTC
From: DCM01@USA.NET
Message-ID: <39cf5169.1959820@news.CIS.DFN.DE>
Source record: 41639

This announces our weekly IRC chat for Atari 8bit enthusiasts.
It's scheduled for September 26th, 2000, 10:30 pm Eastern US
time.

Here are the corresponding times for some other
places, choose the one near you.

California: 7:30 pm. Colorado 8:30 pm. Texas 9:30 pm.
London, England: 4:30 AM. Berlin: 5:30 AM. Hong Kong:
11:30 AM.

The topic for the chat will be "8bit Graphics and BBK Artist." For
anyone unfamiliar with BBK Artist it is one of the better or the best
painting programs for the Atari. If you are interested, we should be
able to provide an ATR of this program, which was published in Analog.

General Atari8 chat is also welcome.

This will be a standard IRC chat. It is not a web-based
chat on your browser. You need an IRC client, such as
mIRC. mIRC is really easy to set up, and you can find it at
www.mirc.com. Not to advertise it, there are other great IRC clients
for many platforms, but mIRC is sort of the standard.

The chat will be on Amiganet. Here are some
servers that will get you there:

irc.whiterose.net
thule.no.amiganet.org
linux.us.amiganet.org
au, uk, se, no & us.amiganet.org

Once you log onto a server type "/join #atari8" and we will be there
waiting for you I hope!

From: Pockets <pockets@DUMMYcix.co.uk>
Message-ID: <8qqehalpj1@plutonium.compulink.co.uk>
Source record: 41642

It seems to be a pretty standard aerial lead, as used on most 'period' machines. I have found most 'electrical' suppliers (like Maplins and the small local shops) have something in that dose the job, I am led to belive the XE series have the RF filter built in, rather than built in to the lead like the XL and earlier, so that should do the trick. Certainly works with mine.

> Before you buy.

Without basic or any carts, you should get a blue screen with a cursor top left. (I never had an 800, but you can start an XL/XE without basic, need to for some games, and that ia what you get)

Try plugging it into a telly using a standard cable and see if you get a picture.

My 1084 has a push switch at the front to switch modes between compisite and RGB. The display for the atari is compisite, at the back of my 1084 is 4 standard audio-style plugs, 2 sound and 2 for video. Try playing with that, also check out the video cable. I found a nice monitor cable at Maplins in their audio section that gives good results. though it was very much a case of swapping the leads about at the monitor end till i got it right as there are 4 termials at the end. I'm not sure if the pinouts are the same on the apple but i would doubt it.

I have heard of the TV out put going kapput and leaving the monitor output ok and vice versa, may be you are suffering that?

good luck

jp

6177. Atari 1050 FS

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-26 03:03:44 UTC
From: af332@freenet.hamilton.on.ca
Message-ID: <8qp3mg$7fc$3@mohawk.hwcn.org>
Source record: 41623

Ok, I'm trying to rationalize my Atari holdings, and I need to get rid of a few Atari Disk drives. I have some working and fully tested Atari 1050 disk drives, which include an SIO cable, power supply and floppy with Atari 2.5 Dos on it.

The drives have read, formatted and wrote dos files. The drives work, but in some cases dont sound as smooth as silk. I am willing to sell them for $30 US funds SHIPPED to North America, $20 US funds plus shipping elsewhere.

Black Box and MIO owners might be interested in some Adaptec 4000a controllers I have which have been tested and are fully functional. I have a few of these for sale $30 US funds shipped in North America, and $25 US funds plus shipping elsewhere. The Adaptec 4000a controller converts old MFM drives to Scsi, and they work well with the MIO.

: I indicated about a week or so ago that I would do some research on sources for
: 5-1/4" disks. This is not a final report, but the situation is really pretty
: good so here is a brief update. Both Imation (3M) and Maxell indicate that
: they still manufacture 5-1/4 DS/DD diskettes. No major manufacturer of disks
: that I checked shows this product on their web site, but several still make or
: sell them.
: Verbatim has an on-line store that does list them for sale. A retailer that I
: have used before has plenty of bulk disks: http://www.mediasourceinc.com/
: I checked several other disk sellers that show that they have plenty. The
: "clock may be ticking", but for now there seems to be plenty of 5-1/4's.
: Larry

I was given a large number of them, and have given tons away. I offered
them at about 10 cents a piece in the past to pay for my time shipping
them, and had no requests. If anyone wants about a hundred 5.25 used
floppies for $10 plus shipping, let me know.

I think if anyone asks around they can get a number of them for free.

Yeah, but for a start it's the novelty of the thing; making a home
system into a portable. And a VCS, no less. Still, that cost I think
could be dramatically reduced if he could find a place to buy small
quantites of TFT displays.

>Does kind of suggest what the portable TV manufacturers should do. As long
>as they are doing a portable hand held TV, they might as well bundle it with

That'd be rather interesting, and for once a *good* combo device.

>AFAIK, there are no CMOS 6507s. I imagine you could do it with a 65C02 and
>other CMOS parts.

I dunno if that'd suffice for games written with some dodgy practises.
Plus, I think it'd be rather hard to find RAID chips...

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

as he typed:

>Has anyone else had problems with sound using Atari800Win V. 2.6c in
>Windows ME? Version 2.6a works just fine, but v2.6c doesn't have sound,
>no matter what the configuration is. I was just wondering if anyone else
>has had this problem.

I get sound fine under WinMe and 2.6c. The difference I think is that
2.6c (and b?) uses DirectSound for sound output, so you may want to
investigate things on that end. I'm running it under WinMe, DX7.0a,
and a Sound Blaster Live! Value card.

>BTW, for what it's worth, and if you haven't already guessed, there's no
>need to rush out and get Windows ME if your Win 98 is running just fine.
>I am installing it on new systems for work and, of course, emulator
>compatibility is one of the first things I check out. :-)

Same here when I installed it. So far everything's cool. :-)

Have you seen the specs for a serial mouse? I can't remember all the
details, something like "packed data @1200 baud". ~Bits 1 & 2 are mouse
buttons, followed by XY directions and speed.

I would guess if you wanted to do it right, you could add a 6551 to the
memory map and have some interupt driven code to service the mouse.

But then I have been looking at microcontrollers a lot lately. Seems like
the same thing could be done with a PIC or AVC.

FA: Huge collection of Antic magazines

I have a huge collection of Antic magazines for auction. Many early, rare, and sought after issues are included. Some bound/hardcover volumes as well.

Prices range from cheap to reasonable. Will be adding more over the next few days..

The current auctions can be viewed at:

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=nicheware

I have used it in KoalaPad, Print Shop, and as opposed to paddles in Super Breakout. It wiggles a lot, but I like that effect (better than paddles on the 8bit games).

Hell yes. If I can't play Star Raiders on AtariWin800, SunDog on
WinSTon or Pirates! on WinAUE then I can't use it <g>.

I'll be installing ME this weekend on my wifes machine (try it on her
first). Curious to see how all these emus will work.

6193. FS Atari 800 16k memory modules

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-27 00:05:58 UTC
From: Dave Warren <dwarren@tds.net>
Message-ID: <GRaA5.3790$4j7.728502@ratbert.tds.net>
Source record: 41553

I have 3 16k memory modules for the Atari 800. I bought
them from a thrift store to put in an 800 I am putting
together for my son. When I got home, I saw the 800
already had 48k ram. I may be wrong but these appear
to have never been used. I have no idea if they work or
not though.

I will sell them together or individually to the best offer by
email by friday 9/29/2000. Buyer pays actual shipping cost.

I have other Atari items to get rid of but it's mostly 130xe
and 800xl computers missing power supplies and some ST
stuff. (I won't list the ST stuff in this group)

Thanks,
David Warren

Hi Everyone,

Thinking seriously of creating a new user group for Atari. It will be called AFAN (Atari Friends and Neighbors). The mission of this group would to create an internet directory of worldwide Atari users to corrosopnd by e-mail, not nessecarily as a help group, but to create common discussion and bonds between those who share common interests and would like to network with others.

So, tell me, what does everyone think of this idea?

Lykewyse/Jessica S. Cornn

P.S: If you would like your name added to the list, please reply to this by e-mail with your name, e-mail address, Atari specifications (like what systems you use), and any ohter interests you would like to share. I will let you know if (and when) the group is created! Thanks!

I regret to have to inform you that one of your fellow message board members has lost her three year battle with cancer. Treatment had at first been succesful at putting it into remission for well over a year, but unfortunately, within the last few months there was a more widespread recurrence. She finally succombed to an inoperable growth in her brain in which chemotherapy and radiation where unable to knock back it's advancement. She will be greatly missed.

Don't forget that they also get there power from the serial port. You
would need both +12v and _12v running through a couple of rs232 buffer
chips. otherwise, could be done. need to connect it to the
parallel/cart port to get the best speed from it. Could be done
through the joystick ports if needed.

Hi Folks:

LLpwhite typed:
> ... Both Imation (3M) and Maxell indicate that they
> still manufacture 5-1/4 DS/DD diskettes....
> ... I checked several other disk sellers that show
> that they have plenty. The "clock may be ticking",
> but for now there seems to be plenty of 5-1/4's.
LLpwhite went silent.

Something I recently (09/24/00) found was this:
The resellers listed on Imation's site, have marked
the 5.25" DS/DD disks as discontinued. (I wasn't
looking for Maxell's model.)

Correct me if I'm wrong here, please!

In a worst case scenario:
Couldn't one buy "unformatted" 5.25" disks, and format
them accordingly?

TIA

Hello Carmel,
do you have the newer Howfen DOS versions 3.8 and 4.x mentioned above ??
I have merely the older versions 3.00 and 3.07. Besides, do you know if
Howfen DOS is PD ?? I found it in several PD catalogs and collections
(like Bellcom, ABBUC, Page 6, etc.), but I heard somebody saying it is
not PD... Can you give any proof about that ??
If you have the newer Howfen versions, please send me a copy !!
(ATR, DCM or XFD). thank you, -Andreas

Well,
but Micro-Discount also had the rights to former Zeppelin games (or at
least they said they had the rights to these games). Besides, Micro
Discount and Zeppelin Games were both British companies...

While I never spoke to Tasha, I feel a sense of loss at her passing. Our small group of devotees is now that much smaller. My heartfelt condolensces go out to you and all who knew and lover her.

FamilyNet HQ: Telnet:\\www.family-bbs.net

Hey there, how's the week going for you so far?

Quote of the week:
"Experience varies depending on the amount of equipment broken."
-A warped quote from the WARP9 Screen saver for the Atari ST

This message is being sent out by JYBOLAC (Just Your Basic Online
Atari Computer) with some quick announcements about various meetings and
activities. Hopefully if nothing else, you'll find the above quote at
least useful. :)

-= ATARI COMPUTERS AND GAME SYSTEMS MEETING IN DALLAS =-
Meeting in the area of 635 and Josey Lane. Great chance to get
together, pull out various game systems and play other opponents in your
game of choice on that system. Also showing a server system for the
Atari Jaguar game system, and other topics yet to be announced. Looks
to be fun. If you'd like to attend please drop me a note to RSVP at :
greg.goodwin@fmlynet.org

(Note: If you are no-where near Dallas (for those that live in other
states and countries besides Texas) It is OK IF YOU CAN'T MAKE IT.)
(grin) Got a few messages from people in other states and such
apologizing. This is really understandable.) ;)

-= ATARI JAGUAR GAMERS LIST =-
Randy Femrite, being the absolute Jaguar fanatic that he is, is
putting together a list of the Jaguar players throughout the world. He
has only had this request out two weeks and already he has gotton 65
replies. He would like at least 100.
If you are curious how many Jaguar 64-bit game system players there
are out there, jump on in and tell your friends to give their
information to:
Randy@atarijaguar.net -or- Femriter@aol.com

-= MEGA ATARI LIST 2000 =-
It was a year ago when the first Mega Atari list was put together
(and several have existed before that, like Sir Smedley's list) and now
JYBOLAC would like to update that list. The idea is hopefully bring
together Atari fans from around the world both for the sake of penpals
and trading, but maybe to help establish meetings of Atari users in a
particular location. To have you and your friends added to this list, just
write to:
Jessica Cornn - beadsandbangles@earthlink.net

-TONIGHT!!-
-= ONLINE ATARI (Thursday Night) CHAT: (Weekly Atarian hangout) =-
It's always a great pleasure to kick back in the tail end of a week
and talk about Atari systems, trade hobby secrets, and gab about
everything under the sun. Join us at:

http://stargate.cs.swau.edu/atari

Meeting times....
Pacific: 6:00 pm Mountain 7:00 pm
Central 8:00 pm Eastern 9:00 pm
U.K. 3:00 AM.
Germany 4:00 AM.
China 10:00 AM.

A great remainder of the week to everyone.
Greg Goodwin aka "Doctor Clu"

I've recently looked at mice too. Some of the stuff they do to get the
prices down to $3 or so for a cheap mouse are kind of odd for a commercial
product.

They really only run of 5V, but what they do is run the +9V out of the
serial port through the LEDs for the photo/interupters. They do this in
series such that the voltage is dropped down to ~5V.

There doesn't appear to be a lot of collaboration going on. Quite a few
different schemes with IIRC even using the TxD line with blocking diode/cap
to get a little more juice on some.

So making it work with a specific mouse with 5V could be as simple as
cutting a trace on the mouse PC board and adding a jumper and a resistor.
Probably too tough to figure out every mouse in the world though.

You'd have to format them in any case as preformatted PC disks are
formatted with 512 byte sectors.

It would be better to do it in software for a standard type mouse that
is still currently available in mainstream stores, and that plugs into
a joystick port without modification. Just to prove I am not crazy I
just disconnected a Micros oft mouse I had on a spare 486, and plugged
it into a joystick port on my Atari 800. It fits.

I had been describing that type of mouse as a "serial mouse" but maybe
others refer to it differently. Have not browsed the racks at CompUSA
very recently but I believe that type mouse to be current available.

I am rather off in dreamland I suppose, but I would like to have a
mouse driver that would monitor that mouse and give me a pointer in
Atari BASIC, and allow use in other programs such as BBK Artist (which
I know would require a rewrite).

If you can forget everything you know about mice for a minute I may be able to convince you we should be thinking "outside the box" on an 8 bit mouse.

First off, I do like the ST mouse and have used it with Missle Command to get a personal best. I know I am thinking about reinventing the wheel.

Since the thing would make the most sense being hung on a J/S port, might as well think in terms of a J/S based design. That means you have 5V available, 2 sort of AD converters, 4 bits, and a trigger input.

So for me an ideal mouse would be something like a normal mouse that has been hacked to run on 5V < 200 mamps from the J/S port. Something like a frequency of the interupters to current conversion to give a paddle value that translates directly to velocity and and direction given by the 4 bit port readings. Mouse button could just be handled by J/S trigger.

Alternatively, something that just has binary counters in the mouse may work. D/A could be as simple as a resistor network, maybe have the reset of the counters tied to a mouse button to center the cursor or home it.

A lot of mice just use PIC micro controllers. Seems like it would be relatively easy to plug a new one in that uses the same lines they natively

use for serial communication to drive the Paddle inputs.

Hi there.

I have a problem with my disk drives:
I have three 1050 drives, the first with a Speedy 1050 extension.
The other two are configured as disk #2 and #3. I checked the id
configuration and every disk drive is actually working, but all three
drives are connected and running, I can only access the first two drives.
Is there anybody having simular problems?
Can somebody help me?

Thanks

Jochen Schäfer

hi andreas,
i can only say that when we wanted more games ported to N.A. format,
discussions had just started. then all of a sudden one of us U.S.
dealers got e-mails over certain titles not being owned by
micro-discount, and that were really owned by authors who were behind
the iron curtain at the time.
then micro-discount disappeared.
we never heard from him again. there were certain titles that i wanted,
plus certain titles that we wanted ported over.
but that is now history. i want to put some on cart like ZYBEX,
thanks,
lance

DOS 2 type DOSes default to two drives.
Boot DOS and BASIC.
? PEEK(1802)
if it is 3 then you only recognize two drives.
To get the 3rd drive, poke 1802,7. Then go to dup.sys (type DOS)
and write system files. Next time you boot that DOS, you'll recognize
3 drives.
If you want four drives, poke 1802,15.

You have to be kidding. The Panasonic would go for about C$10 in a local
thrift shop and noone in his right mind would buy an Epson Stylus with
any expectation that the print head would not clog up.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

You are more technically minded than me. I think I am more practical,
in that I am suggesting it would be better to have software drivers
for a currently available mouse, than a soldered mouse with a homemade
circuit. Even if the hardware solution is better, people are less
likely to use it than a software driver for a mouse they can go out
and buy at a computer store.

>A lot of mice just use PIC micro controllers. Seems like it would be
>relatively easy to plug a new one in that uses the same lines they natively
>use for serial communication to drive the Paddle inputs.

Using the paddle inputs would be a great solution because 1)
programming languages and much software already are set up for paddle
input and 2) there is not only the potential for horizontal and
vertical movement with acceleration/deceleration but also each set of
paddles offers 2 triggers, so you would have two mouse buttons.

Hello Jon, I had the same thing happen on an Atari 810 drive. It turned out to be the Analog board inside the drive. I had another non-working drive and was able to switch it out. I don't know anything about the internals of a 1050 drive, so you will have to find schematics etc...easier to get another 1050 on Ebay.

I also went through several "original" disks before I figured out what was happening. It destroyed disks even with the write-protect sticker on. Good luck fixing yours.

Right, the ST mouse is just a fancy 8 bit "Atari Driving Controller" or
"Atari Trackball". The didn't reinvent the device so much as repackaged it
inside a mouse. Movement codes are identical to using a trackball, so for
Missle Command you just press 't or <ctrl>'t and it goes to trackball mode.
<snip>
> You are more technically minded than me. I think I am more practical,

Depends on what they are using it for I would imagine. What I mean by this
is it is unlikely you are going to get the mouse support in AR The City or
PacMan. You could, but you would have to add it to the OS ROM which is
another kettle of fish. It becomes a technical problem again.

Les Brilliant<sp?> did an article for ANALOG where he modified an IBM J/S
for use on an Atari. So there exists software for reading the values and
cursor positioning if you run a mouse from the PADDLE ports. That is why I
was thinking PADDLEs anyway.

>
> Using the paddle inputs would be a great solution because 1)

I know, I wish I had thought of it instead of Les Brilliant.

It should boot to BASIC (only takes a second with no peripherals
attached), so it isn't behaving correctly.

6236. Connecting a Atari to a Commodore 1702, HELP!!

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-29 00:00:00 UTC
From: Dan & Jeri Williams <dwilliams@milwaukeepc.com>
Message-ID: <39d547a8$0$250$3936f1fe@news-core.twtelecom.net>
Source record: 41459

Hey all,

Just picked up a 1702 off of E-bay cause I was tired of my little old TV. So, when I got the thing it came with a monitor cable that was supposed to work! Guess what? It didn't. Seems that the C 64 had a 8 pin cable and the good old Atari uses only a 5 pin.

What was my solution? Go back on E-bay and buy a 5 pin cable. Now heres where I start to go insane. The cable I ordered has 4 plugs. The atari 130 XE manual I lucked out having says that the pins are for 1- Composite luminance, 2- Ground, 3- Audio Output, 4- Composite Video, and 5- Composite Chroma. Sounds all good to me, since the cable represents all those.

This is why I am insane. The 1702 doesn't have 4 plugs. It only has 3. One for sound, and two for who knows what else. Will I need all cables connected? Any help would be appreciated!

Thanks

Daniel

Atari User Since 78!

Well, If you just turn it on, you should get a blue screen that says ready.
And If you hold down option and turn it on, you'll get a test screen.

Odds are that the two non-sound jacks are Chroma and Luminance. Try them
one at a time.

You could probably get more specific advice by posting in one of the
Commodore news groups.

You are right about the original being done with a RS JS, but I used an IBM
to do the hack. They are the same thing, two variable resistors with caps to
check the charge times. There was something odd about it, like the IBM used
100k pots and the Atari expects 1 meg ones, but I just increased the cap
size by a factor of 5-10ish<?> to get them on scale.

Pretty sure Apple II J/S are the same thing too.

The Rockwell Made in Mexico 6502s really do go out a lot.

But if you are getting any video it may be something other then the
processor. Video, even screwed up, means the processor probably may have got
as far as initializing the video chips then bailed. IMO: Check the dram too.

Re: speech synthesiser for atari 8-bitOne of the Atari magazines (Analog?) printed schematics for a voice synthesizer using the (I THINK) SP-AL256 speech processor from Radio Shack. It hooked up to a couple of joystick ports. It was fun to build and done with wires on a breadboard instead of making a real pcb caused enough RF interference to crash the auto pilot of any passing airliner :-) I recall seeing adverts for a similar box that hooked up to the joystick ports in the magazines a few months later, but can't remember who was selling it.

I had written a driver for it that worked off the vertical blank interrupt, so you could dump a string of phonemes to the handler and it would feed them to the box in the background while the main program did went on its merry way.

Hey all:

I need some advice.

I bought a 1050 (U.S. Doubler) Floppy.
It gives me the flash, I insert the disk.

Nada.

Nada darn thing.

I pull out the floppy, and *GASP* its blank.
No format, no nothing.

I get the Millennium *D'0H* Award since I tried
around 8 (original) disks before I thought to
recheck them.

... d'oh. =(

Now the odd part is occasionally, (twice) it
actually tried to read the disk, then choked
with a BOOT ERROR.

How do I trouble shoot this silliness?
Is there something I'm totally blind too?
Could the Peripheral port on the 800XL be flaky?
How can I fix this problem?
What possessed me to go through 8 disks?

Please, stop me before I erase again!!

TIA

I used to order a lot of disks from Bellcom, but foolishly threw away the catalogs I used to receive. I now find a catalog would be a great help to me, to organize my (unmarked) disks without having to load up every single one.

I don't suppose anyone out there has any catalogs they'd be willing to part with, or any ideas on how to obtain one? Heck, the address of the guy who ran Bellcom would help; I'll bet he might have a few lying around. ;)

Thanks,

Mike

Hello,

I am the author of Westfront PC: The Trials of Guilder, a new
public domain text adventure for the Windows 95/98/Me/NT/2000
operating systems. WFPC has been in development for some time.

Homepage: http://www.geocities.com/dunric/westfront.html

Originally conceived on the Commodore 64/128 in May of 1993,
WFPC has grown considerably in size and now rivals online MUDs
, both in size and overall gameplay.

In addition to the release of WFPC on CD-ROM (in April of 2001,
with 50% of the proceeds going to a charity of the buyer's choice)
I am looking to port the game to the following platforms:

o - Macintosh (68k, others)
o - Unix/Linux
o - Atari ST (520 and 1040)
o - Amiga (600,1000,1200,2000,etc.)
o - TRS-80 (Models 1-4, Color Computers 1-3)
o - ZX Spectrum
o - Apple II/IIe
o - Atari 8-bit
o - CP/M (2.2 or less, with terminal emulation)
o - TI-99/4A
o - Wang (300 meg disk packs not required)

In addition, I'd love to see Westfront PC translated to
large scale computing devices, including:

o - DEC PDP-10
o - IBM 3271/72
o - IBM 709

And if anyone wants to tackle porting the game to the Cray-2
Supercomputer, be my guest. =)

I'm serious about the others, though.

Written in BASIC, WFPC should be convertable to most
modern systems because of the limited use of language-
specific functions and subroutines. As long as the
computer system can get by with Minimal BASIC or
Tiny Basic commands, then WFPC is possible (PRINT, FOR/NEXT,
IF/THEN,DIM,COLOR,CLS,MID$,LEFT$,RIGHT$,RND/INT or equivalent)

Please direct all comments, suggestions and inquirements to:

dunric@yahoo.com

Regards,

Paul

Rick Cortese fell silent.

I have looked at this, and I also have the source for
Crow's "SIO2Linux" project. Unfortunately, both the
cable manufacture and the concept of implementation
escape me, since I've never dealt with either.

Any advice would be appreciated.

With Atari BASIC and Turbo BASIC for the Atari, all your LEFT$, MID$,
and RIGHT$ functions would have to be converted. eg. LEFT$(MYSTRING,5)
becomes MYSTRING(1,5) etc.

You do recall correctly. The main trouble with it was that it turned off the screen display to speed things up a bit.[1] (There was a hack somewhere that let you use (I think) mode 1, but it sort of spoiled things...)

[1] This seemed to always be the way with "quality" sound; pretty much anything with sampled sound or synthesised speech blanked the display whilst doing it, with the exceptions of Nadral (now what WAS that all about) and some air-traffic-control game I had, the name of which escapes me. ("This is flight BA147; emergency, three minutes fuel remaining...")

Too numerous to mention...

The Eidolon:
Full screen real-time 3D graphics! Wowza! (Along with a lot of other
Lucasfilm games -- Fractalus, etc. I just LOVE the loading flash
screen; that "Neeeeeeooooooowwwwwwww.... TING!" noise is worth the
price of admission. :)

Whistler's Brother:
Bizarre platform action, great name.

Ultima I/II/III/IV
The only annoying thing is that in the US the artifacting produced
white, blue and orange but in the UK it produced, um, a bluey/greeny
blur. Real shame...

Nadral:
What the hell? Strange concept -- fly a sort of helicopter around a
disorientating maze avaoiding toilets, bouncing balls, and who knows
what else, accompnied by an eerie background noise that got faster as
things got more difficult. Nice music, too. Spieler 1, schloss!

AOTMC/ROTMC:
Cloven-hooved ungulate action!

The Last Starfighter (or whatever it was called -- it was the sequel to
something...):
"3D" space combat. "Texture mapped" planets. Cool!

I could go on, but I won't...

The only air traffic controller game I remember that had speech was
Kennedy Approach.

The reason the display was blacked out was because the program turned
ANTIC off. With ANTIC turned off, the 6502 didn't have to worry about
doing things like updating the display listt, so it was able to
dedicate a little more time to transferring the audio data to Pokey,
resulting in better quality sound.

Incidentally, another game that didn't turn off Antic was Whomper
Stomper.

Okay, I'm nitpicking... but technically texture mapping is the mapping
of an image on a three dimensional mesh object. This can be realtime
or pre-calculated. Alternate Reality was pre-calculated. The Last
Starfighter simply took the image of a planet and warped the image to
simulate a spherical object by progressively eliminating more and more
pixels towards the top and bottom of the image (or, put another way,
buy progressively shrinking each line of a square image as it reached
the top and bottom) It was a neat effect, though -- very clever. :-)

Hello Lance, Hows the Atari thang going, Keep those atari thangs humming
that's what I say

Anyway regarding microdiscount and zeppelin games, only the most recent
zeppelin games were from polish/e. eurpoean authors, the majority like
draconus/zybex/phantom etc were done inhouse or had bought licences from
the respective s/w companies like futureware (sidewinder) etc
Re the copyright issue, I dont thing it had anything to do with
Microdiscount, as microdiscount only had bought sales/marketing and
distribution rights, and only the rights to the s/w that zeppelin
published/wrote itself

I Trust that this clears up the matter

I would be interested though, in obtaining a british version of
computerhouse's (fulham, London) FLOPPY CARD, which if memory serves me
correctly, was the first floppy card that allowed the humble 8bit to
utilize the st/amiga d/d's (both 5.25 & 3.5), I believe that
computerhouse's jobbie was imported from a US company, I dont know who
The Floppy board that derek fern/microdiscount came out with was
actually made by css (new york) the reason why it wasn't heavily
promoted was because css/derek fern didn't want atari finding out that
their floppy board was based on the xf551's innards (so I was told)

Anyway, I'm still looking for the css product "the impossible" that is
the orig. 800 and xl versions, the german program "the freezer" by LDS,
not the freezer by digicomm (which ran a bit like the superdump/iv
portion of the o/s controller card sw) and also the other 2 booklet that
came with the indus gt (a8), and information relating to
upgrading/expanding the indus gt (a8)

Any help....

Happy Atari'ng

Hello there Ernest/Vidar, Hows your atari's going, Just keep the faith, keep those atari's humming

Anyway re: howfendos v3.8 and 4.0, I still have the originals, but i don't have Ape Int. or SIOPC, but what I do have is a pc (amd duron600, 128meg, win98- which can be up'd to k7 athlon/thunderbird) as my pc has an int. 5.25 and 3.5 inch d/d
I do have 2 proggies called anadisk and deanna, tried everything but cant get my resultant .atr files to work with mess and a800win, this is due to the crapshit instructions on how to use these programs with REAL atari 5.25 disks

If you or anyone can show me how to use these proggies with real atari disks, or a program or programs that allows you to do this, then what I will be more the happy in doing is emailing you both 3.8 and 4.0 versions of howfen and provided I don't get me hands slapped by page 6, I'll even throw in transdisk 4 and xe

Anyway the reason why howfendos wasnt pd is because, It was originally a commercial product,available though howfensoft, they used to advertise in Atari user magazine (database), the other reason for it not been pd is that the program allowed you to convert rob c and ian k/elton files, to howfen, and if you know anything of the A8 scene in GB in the 80's, you'd know that rob c/ian k were pirate menu's primarily based on John Williams's Multboot menu (the same john williams that wrote s/w for english s/w- jet boot jack- etc,etc)

Also, according to the above atari mag the European/American Atari users didn't like Howfen/Rob C type menu's, prefering instead to using dos type menus like speed init or microdos etc..., I remember a friend telling me once, that he sent some atari files on howfen and multiboot, in exchange for some recent american/european stuff, only to find that when he got the disks back from his euro/US contacts he found some very choice language written on the oncreen text.. telling him that unless he convertsa over to using a dos menu, he shouldn't bother sending anything

I always found, that the are big problems with game dos menu's, they take up more space then howfen/robc and you have to use the particular dos menu/with a particular dos, and even then you cant guarantee that the file will load, because your'e dealing with a binary file

The nice thing a found about howfendos is that you'll know that the howfen menu will always load in low memory, leaving max ram to the program, and you'll find that most of the howfen stuff (both single and multistage/file) will always load in a majority if not all the files

What I would like though is an a8 program that will allow be to convert multipart split binary files compacted/compressed with bewesofts superpacker or Cruncher 5 from magnus (the one on mega magazine) and convert then to boot tape, as I have working binary versions of zybex, Redmax, Shit, Rockford etc and about 3-400 other bin files that I created with howfen t-d, omni-mon and superdos, that I would like to get onto howfen. for conv. to Atr file

Any help...

Happy Atari'ng

WE'RE BACK!!..

CCAG 2001
(Classic Computer and Gaming 2001)

If you like collecting old computers, video games, and enjoy using them
still, then come join us on:

June 23rd, 2001
9AM till 6PM

National Guard Armory
IT'S ON ROUTE 57!!!

(actual address)
3520 Grove Avenue
Lorain, Ohio 44055-2048
(On Route 57, going North of I-90/Route 2)

IT'S FREE!

Both vendors and attendees!
Computer User Groups and vendors inside, flea market outside!

Setup: 22nd, June, 2001
6PM-10PM

Please Call Ahead for Reservations:

Jim W. Krych jwkrych@n2net.net
440-979-9295
Fred M. Horvat fmh@netzero.net
440-286-2566
And these other CCAG 2001 organizers:
Thomas J. McLaren sirthomas@uk2.net

Please visit this site:
http://tomheroes.com/ccag.htm

As of 9/29/2000
User Groups:
Erie PA Atari Group
TI Chips
Cleveland Classic Atari Group

Vendors:
Tomorrow's Heroes
Retropolis
Songbird Productions
Video Game Connection
Ramcharged Computers

People/Organizations:
Fred Wagaman
Alan Hewston
Thomas Mclaren
Andy Frueh
Tim Snider
Curt Vendel(Atari Historical Society)

We are looking to do a "Classic Game Experience" this year!
One room is going to be set up for playing classic computer and video game cartoons and commercials. The other room is going to be an emulator room- MAME, etc. We are hoping for some people with arcade systems to bring them- will probably need a small generator for that.

See ya at the CCAG!

Source record: 41493

I have an 800xl, instead of booting to Basic it boots to the self test
and gives memory errors.

I have a couple of Questions:
Do the little memory boxes give particular chips that are bad?

Even whit bad ram wouldn't it still boot to basic?

Any help or ideas would be appreciated.

Steve

P.S. If anyone knows where I could find a service manual on the 800xl
that would be helpfull also.

>
>Please, stop me before I erase again!!

Before you start tossing your disks, check your SIO cables. I can't
tell you how many I went through in my 8-bit years. They get frayed,
they die. Often. (Well, with me they did anyway) Try another SIO
cable, preferably one you know worked the last time you tried it.

Other things you might want to try:

- Try blowing out any dust that might be both in the cable's contacts
and in the Atari's SIO port. (A can of compressed air will help; you
can blow in it yourself, but the moisture in your breath may do more

harm than good)
- Open up the 1050 and try re-seating all socketed chips to remove any oxydization of the pins. (an IC puller or, if you don't have one, the tip of a small flathead screwdriver will do the trick, just make sure they all come out of the socket reasonable level so that none of the pins bend) While you're in there, you might as well blow any dust out of there, too.
- Clean the drive's heads; you'll need a 5.25" drive cleaning kit for that or, if you don't have and can't find one, while the drive's open, use a cotton swab or very soft, lint-free tissue dampened with isopropyl alcohol or hydrogen peroxide and gently clean off the head manually.
- Try jiggling the disk in the drive while it's trying to read the disk; if the disk is only partially bit-rotten, this may force it to read the bootsector properly.

And if none of these suggestions work ... congratulations! You have a new drink coaster. :-)

And yes, I've done all of the above many times in the past. The woes I had with 5.25" floppy disks are almost legendary. :-)

<curtis2000@earthlink.net> drooled an embarassing wet spot in his lap
as he typed:

>Just picked up an 800 xl at a yard sale.(thought it might be cool to have
>one).
>
>My question is what should it do when i turn it on? I have no software for
>it and all it does is give me a black screen when i turn it on.

With no peripherals and no cartriges inserted into the cartrige slot,
the machine should ... erm ... "fart" (well, that IS what it sounds
like!) for a few moments at a blue screen with a white cursor in the
upper left hand corner of the screen, then plop you at a READY prompt
(Atari BASIC). If you hold OPTION while turning the machine on
(again, with no peripherals or cartriges attached), it should go into
self-test mode.

Actually, that's not entirely accurate; you can attach a printer or an
810 or 1010 tape drive and the above is still applicable, but a floppy
drive will immediately try to boot if it's hooked up and, obviously,
cartriges will execute immediately.

: connected? Any help would be appreciated!

This is not too tough. In fact, if you'd taken a little time to read the
labeling on the 1702 plugs, things would have become very clear!

The back of the monitor has three, as you pointed out. One is audio (3).
Another is composite luminance, or Luma (1). The third is composite Chroma
(5). Problem solved!

I believe that Bob Wooley now has the entire library.
There is no catalog on disk as far as I know. We asked him
a while back. I don't know if he might have hard copies left.
The Bellcom library is on the Pooldisk Too,
so if you just want to check what files are on the disks, you
can use Xdir on a Pooldisk for that.
At one time we wanted to scan and OCR the catalog and
supplements. Maybe sometime we or someone else can
do that and post it.

Keep those XL's/XE's humming.
Ernest.

I came across an Atari 810 disk drive that would kill formatted disks when placed in it. I just sent it on to our resident Atari disk doctor who fixed the darn thing. Turned out to be some logic board.

Since this is a US doubled drive, perhaps pulling out the upgrade and installing it in a working drive is the best way to go.

And, I just happen to be getting rid of Atari 1050 Disk drives for $30 US shipped to North America! (shameless plug) hahah

curtis2000 waited....

Just curious, are your trying it on a monitor
or television?

On a T.V. It would do this if set to the wrong
channel. On a monitor, the port may be blown,
but I believe the T.V. port MAY still be able
to work. (Unless the main logic board is
fried.)

If I rememeber right... now bear with me in my
old age. I'm the guy that picks up the phone,
dials the number, and as they say hello, I
forgot who I was calling. :-/

But, If I remember right, the internal switch
box does NOT need an RF Modulator (radio
shack-$20-ish?) But if the switch itself is
blown I think its possible to still get it
connected through an RF Modulator. But again,
I remember doing something like it, but this
was like... 16 years ago.

So... not to ramble, but I would trouble shoot
it this way if I were you..

HTH,

6275. The Chicken? The Egg? An Atari DOS Boot Disk Question.

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-30 05:13:39 UTC
From: Jon Tibbetts <nuclearspam@home.com>
Message-ID: <39D576E6.926C8176@home.com>
Source record: 41477

I'm sorry to hassle, you guys are great, but I'm
confused about the creation of a DOS Boot Disk.
(I lost all boot disks on a floppy mishap a few
days past.)

I run Slackware Linux on my PC.
I made a very small portion for PC-DOS.
I have an 800XL with a borrowed 1050.
I can (supposedly) read & write files in Atari
format with utilities like ATARIDSK and such.
I can extract the BOOTCODE, and *.SYS files
needed, copy them to the disk, but how do I
initialize the bootstrap?

This was easy with the Atari running on DOS,
but with no boot disks, I fall into a circular
reasoning pit I can't seem to crawl out of.

Does anyone have any suggestions?
(I doubt if APE is made for Linux.)

Thanks for your time,
--Jon

6276. Toasted 130XE

Newsgroup: comp.sys.atari.8bit
Date: 2000-09-30 06:16:04 UTC
From: burnin <burnin@addy.net>
Message-ID: <39D58524.3F37FC1B@addy.net>
Source record: 41478

After moving I hooked up my 130XE and it is toast. I get a reddish screen that flip flops all over the place. There is no sound of booting or key clicks. I looked at all the basic things, power supply, connections, etc. but it looks to be serious. I'll have to take the machine into work to throw an O-scope on it but I don't want to waste my time if parts are not available. I suspect that either the 6502C CPU, GTIA, or Antic chip is burned up. The CPU gets kinda warm, however, I don't know if this is normal or not.

Does anyone know of a source for chips or will I be wasting my time to try and revive this relic?

burnin

6277. Re: Problem Solved

Newsgroup: comp.sys.atari.8bit

Message-ID: <39D6E450.115766E1@addy.net>
Source record: 41497

I hauled my 130XE into work today and threw it on an O-scope. The signals flowing through the machine looked somewhat normal but something was obviously intermittently causing strange fluctuations in the signals. It looked to me like the system was reseting over and over again. I put the scope on the reset circuit, that is supposed to have a momentary low signal when a reset occurs and then remain high, and noticed that the circuit had a 60HZ pulse on the reset signal. I immediately put the scope on the power supply, which looked okay with my volt meter at home, and found that I did not have a solid 5 volts out of the supply. It looked like I had lost a rectifier. Opening the supply revealed the transformer and circuit were encased in a cube of glue, virtually impossible to repair. I chopped the cords off and found a new 5 volt supply to attach them to. With the new supply hooked up the system is back to normal. Woohoo!!!

I too would expect it to still boot to BASIC even if it had a bad RAM chip. I suspect that there may be a problem in the memory addressing hardware. I have no idea if there is a relationship between the blocks and specific RAM chips. Each byte of memory is constructed with a single bit from 8 seperate RAM chips, however, it wouldn't be hard to have the memory test program test bits for each chip.

Hence "texture mapped" in quotes... (And texture mapping does NOT have
to be on to 3D mesh objects; the ray-casting technique in Wolfenstein
3D (for example) allowed txetures to be mapped on to Boolean planes.
(But now who's being picky? :) (Oh, and it was Star Raiders 2!)

That was the first thing I hoped for all chips but one are soldered to
the board and all solder conncetions look good..
Before I started soldering the chips I wanted to find out a good place
to start. Ram chips or Addressing chips.
The bad ram blocks don't seem to have a problem so I'm pointing to
having a bad chip in the memory addressing circuit.
Any other thoughts?

i think i can help ,

it might sound a little scary but it isn't that hard and once you do it a few times it will be fun and eas and addictive , soon you will want better pictures for all you old systems

now as i under stand it you have the 1702 monitor , (i hope you didn't pay too much , the 1902 and 198? are MUCH better and ylou can hook up arcade board to them

any way what does the cable you haev plug into ,,,, i am going to try and walk you through hacking the end off the wrong side of the cord and puttin gon a new one

i've made rgb cables so i can play neo geo arcade games on my desk and the picture was so much better then the home version i made cables for other systems and want to now start drilling holes into beater systems just to add the outputs
Danno

Jason, I guess I didn't word myself quite right, I did read the back of the
monitor, and
I did understand what it meant. As I know now, the only plug that was
throwing me off,
was the Composite Video. I know now that the plug won't be used due to the
help of
other users.

Next time, don't be so rude about it.

Dan

Do you have MyDOS double density capability on the Atari 5.25?

The is a European utility called "Ataridsk.exe", not to be confused with C. Marslette's "MyUtil.exe" which is sometimes named AtariDsk; it can read & write files on the hard disk to the PC internal floppy in SSDD. I use something like Atrextr.exe to get the data out of the ATR.

You can use either split Chroma and Luminance or Composite Video, not
both. The Composite Video is exactly what's needed to feed the A8 into
a VCR but generally you'll get better results with the Chroma/Luma
option.

If you're doing a lot of text-only stuff, you get great results using
a mono monitor and just the Luminance signal.

> TV. So, when I got the thing it came with a monitor cable that was
supposed

I have several 1702's although I don't get to use them with Atari's (yet).
:) Be certain that you have the switch in the back set to the correct set
of video ports. If it is set the oposite way.....the screen stays black.
Also, don't be afraid to experiment with plugging in your cables. It is
very hard to kill a 1702. Sooner or later you will hit the right
combination.

>I have an 800xl, instead of booting to Basic it boots to the self test
>and gives memory errors.

Maybe the basic ROM is bad. You can check this with the self test.
The top most longish boxes turn red then.

>I have a couple of Questions:
>Do the little memory boxes give particular chips that are bad?

No, it gives (or should give, that is) memory locations blocks that are
bad. Since the RAM chips of the 800XL are something like 64Kx1, these
areas will go over all chips at once.

Except that, well, some of the RAM tests are simply fakes. The RAM under
the self test ROM (0x5000 and up) is not tested at all and always shown
as "good". Same goes for the RAM under the Os, the basic and the Io chips.

>Even whit bad ram wouldn't it still boot to basic?

Nope. Dependent on what's wrong, it might refuse to do anything useful at all.

So long,
Thomas

Do what I do and go out and buy a 5 pin din to 4 RCA jacks audio
cable. They can be had almost anywhere.
Use a bit of experementing to find what goes where. Works well for
me. If you can get a ribbon type cable, use it.

Not only that, but the time ANTIC needs is not always the same IIRC, so it's
hard to keep timing dependent stuff running (in this case sounding) OK.

BTW if you wanna have your Atari read out english texts, try Tom Hunt's READIT.
It sound great. At the time, Tom told me he had idea's for even better sound,
but unfortunately, his plans never really turned into hardware.

I can comfirm this works, My 800xl and 130 xe work fine with my 1084s thanks
to such a cable. However i found i needed a Y connector to one of the ports
for that extra stability of picture on my 130XE.

SAMS has a Photo Facts for it. Not sure if anyone has scanned them and put
them up on the net as they are kind of large format.

You said the drive "flashed"<?>, does that mean the drive busy light came on
for a split second then shut off or it flashed on and stayed on to flashed
on and off?

6302. Track Ball Mode For A8 Sofware

Newsgroup: comp.sys.atari.8bit
Date: 2000-10-02 00:00:00 UTC
From: Dan Vernon <danver@halcyon.com>
Message-ID: <8ra82sjhd1@brokaw.wa.com>
Source record: 41526

I've been an Atari fan since the early 80s, and have been reading this newsgroup for years... yet I have only just heard (Thanks to Rick Cortese!) that Missile Command has a Track-Ball mode. And that even better, you can use an ST compatible mouse... such as a Best Electronics Track Ball, since the ST mouse is actually just a mini A8 trackball anyway!

What disturbs me is that this is not even hinted at in my original Missile Command manual. I'd really like to add an entry in the A8.FAQ regarding all the Atari software that supports the trackball (and hence the ST mouse).

For now the list is just:

```
Title Keystroke Required
------------- --------------------
Missile Command CTRL-T
```

please email me or reply to this post with info regarding any other A8 commercial software that supports the Trackball (and the required keystroke or configuration to get it to work). Does anyone know if Centipede, Millipede, or Glen the 5200 man's Centipede will go into trackball mode? What about drawing and graphic design programs? Someone hinted at KoalaPad and Print Shop... please respond with more details.

Heyyas,

Rick Cortese typed:

> You said the drive "flashed"<?>, does that
> mean the drive busy light came on for a
> split second then shut off or it flashed
> on and stayed on to flashed on and off?

Rick Cortese cracked his knuckles.

Probably 1 time out of 20 it flashes (no raincoat involved.) And when it flashed its 2 - half second pulses. After that, it refuses to initialize the drive at all.

The rest of the 19 out of 20 times it's dead in the water.

When I initially got it, it fired up (flash wise anyway) normally about 9 times. (9 times = 9 dead disks.) Then it just refused to play.

Upon removal of the cover and very close inspection of the board I noticed the poor solder and the questionable components. (What turns ceramic all white an discolors the bands?) There's a chance that maybe the "Magic Smoke" was released and it has to be replaced with new "Magic Smoke Chips." :) I also have yet to rule out an ancient voodoo curse, but I have no scientific means to test this theory with. =)

Yet. =D

I have a suspicion the answer lies within the board itself, but I have no reference to troubleshoot with. As an alternative, if I had a schematic, I could take a "shotgun" approach and basically rebuild it from scratch. With new parts....

Non cursed....

With "Magic Smoke" intact!

I'm open to anything. AS LONG AS IT DOESN'T
involve a midget in a clown suit and a
chimpanzee in leather....

Well ...

Anything concerning the drive that is. =D

TIA

>Any reason why...

Instructions suggest that you do the format with Ataridsk in the internal PC
5.25.

Both the Indus GT and the Lazer-Happy 1050 should be able to read/write and
transfer files.

-Ron

I don't have a solution but I admire the problem.
